Abstract

The Concise Guide to PHARMACOLOGY 2017/18 provides concise overviews of the key properties of nearly 1800 human drug targets with an emphasis on selective pharmacology (where available), plus links to an open access knowledgebase of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties. Although the Concise Guide represents approximately 400 pages, the material presented is substantially reduced compared to information and links presented on the website. It provides a permanent, citable, point-in-time record that will survive database updates. The full contents of this section can be found at <http://onlinebibrary.wiley.com/doi/10.1111/bph.13878/full>. G protein-coupled receptors are one of the eight major pharmacological targets into which the Guide is divided, with the others being: ligand-gated ion channels, voltage-gated ion channels, other ion channels, nuclear hormone receptors, catalytic receptors, enzymes and transporters. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. The landscape format of the Concise Guide is designed to facilitate comparison of related targets from material contemporary to mid-2017, and supersedes data presented in the 2015/16 and 2013/14 Concise Guides and previous Guides to Receptors and Channels. It is produced in close conjunction with the Nomenclature Committee of the Union of Basic and Clinical Pharmacology (NC-IUPHAR), therefore, providing official IUPHAR classification and nomenclature for human drug targets, where appropriate.

Conflict of interest

The authors state that there are no conflicts of interest to declare.

Overview: G protein-coupled receptors (GPCRs) are the largest class of membrane proteins in the human genome. The term "7TM receptor" is commonly used interchangeably with "GPCR", although there are some receptors with seven transmembrane domains that do not signal through G proteins. GPCRs share a common architecture, each consisting of a single polypeptide with an extracellular N-terminus, an intracellular C-terminus and seven hydrophobic transmembrane domains (TM1-TM7) linked by three extracellular loops (ECL1-ECL3) and three intracellular loops (ICL1-ICL3). About 800 GPCRs have been identified in man, of which about half have sensory functions, mediating olfaction (~400), taste (33), light perception (10) and pheromone signalling (5) [1362]. The remaining ~350 non-sensory GPCRs mediate signalling by ligands that range in size from small molecules to peptides to large proteins; they are the targets for the majority of drugs in clinical usage [1519, 1631], although only a minority of these receptors are exploited therapeutically. The first classification scheme to be proposed for GPCRs [1030] divided them, on the basis of sequence homology, into six classes. These classes and their prototype members were as follows: **Class A** (rhodopsin-like), **Class B** (secretin receptor family), **Class C** (metabotropic glutamate), **Class D** (fungal mating pheromone receptors), **Class E** (cyclic AMP receptors) and **Class F** (fritzzled/smoothened). Of these, classes D and E are not found in vertebrates. An alternative classification scheme "GRAFS" [1737] divides vertebrate GPCRs into five classes, overlapping with the A-F nomenclature, viz:

Searchable database: <http://www.guidetopharmacology.org/index.jsp>

Full Contents of ConciseGuide: <http://onlinebibrary.wiley.com/doi/10.1111/bph.13878/full>

Glutamate family (class C), which includes metabotropic glutamate receptors, a calcium-sensing receptor and GABA_B receptors, as well as three taste type 1 receptors and a family of pheromone receptors (V2 receptors) that are abundant in rodents but absent in man [1362].

Rhodopsin family (class A), which includes receptors for a wide variety of small molecules, neurotransmitters, peptides and hormones, together with olfactory receptors, visual pigments, taste type 2 receptors and five pheromone receptors (V1 receptors).

Adhesion family GPCRs are phylogenetically related to class B receptors, from which they differ by possessing large extracellular N-termini that are autoproteolytically cleaved from their 7TM domains at a conserved "GPCR proteolysis site" (GPS) which lies within a much larger (~320 residue) "GPCR autoproteolysis-inducing" (GAIN) domain, an evolutionary ancient motif also found in polycystic kidney disease 1 (PKD1)-like proteins, which has been suggested to be both required and sufficient for autoproteolysis [1609].

Frizzed family consists of 10 Frizzled proteins (FZD(1–10)) and Smoothened (SMO). The FZDs are activated by secreted lipoglycoproteins of the WNT family, whereas SMO is indirectly activated by the Hedgehog (HH) family of proteins acting on the transmembrane protein Patched (PTCH).

Secretin family (class B), encoded by 15 genes in humans. The ligands for receptors in this family are polypeptide hormones of 27–141 amino acid residues; nine of the mammalian receptors respond to ligands that are structurally related to one another (glucagon, glucagon-like peptides (GLP-1, GLP-2), glucose-dependent insulinotropic polypeptide (GIP), secretin, vasoactive intestinal peptide (VIP), pituitary adenylate cyclase-activating polypeptide (PACAP) and growth-hormone-releasing hormone (GHRH)) [738].

GPCR families					
Family	Class A	Class B (Secretin)	Class C (Glutamate)	Adhesion	Frizzled
Receptors with known ligands	197	15	12	0	11
Orphans	87 (54) ^a	-	8 (1) ^a	26 (6) ^a	0
Sensory (olfaction)	390 ^{b,c}	-	-	-	-
Sensory (vision)	10 ^d opsins	-	-	-	-
Sensory (taste)	30 ^e taste 2	-	3 ^c taste 1	-	-
Sensory (pheromone)	5 ^c vomeronasal 1	-	-	-	-
Total	719	15	22	33	11

^aNumbers in brackets refer to orphan receptors for which an endogenous ligand has been proposed in at least one publication, see [414]; ^b[1511]; ^c[1362]; ^d[1941]. Much of our current understanding of the structure and function of GPCRs is the result of pioneering work on the visual pigment rhodopsin and on the β_2 adrenoceptor, the latter culminating in the award of the 2012 Nobel Prize in chemistry to Robert Lefkowitz and Brian Kobilka [1021, 1137].

Family structure

S19	Orphan and other 7TM receptors	S50	Calcium-sensing receptor	S73	Gonadotrophin-releasing hormone receptors

Orphan and other 7TM receptors

G protein-coupled receptors → Orphan and other 7TM receptors

Class A Orphans

G protein-coupled receptors → Orphan and other 7TM receptors → Class A Orphans

Overview: Table 1 lists a number of putative GPCRs identified by **NC-IUPHAR [557]**, for which preliminary evidence for an endogenous ligand has been published, or for which there exists a potential link to a disease, or disorder. These GPCRs have recently been reviewed in detail [414]. The GPCRs in Table 1 are all Class A, rhodopsin-like GPCRs. Class A orphan GPCRs not listed in Table 1 are putative GPCRs with as-yet unidentified endogenous ligands.

Table 1: Class A orphan GPCRs with putative endogenous ligands

<i>GPR1</i>	<i>GPR3</i>	<i>GPR4</i>	<i>GPR6</i>	<i>GPR12</i>	<i>GPR15</i>	<i>GPR17</i>	<i>GPR20</i>
<i>GPR22</i>	<i>GPR26</i>	<i>GPR31</i>	<i>GPR34</i>	<i>GPR35</i>	<i>GPR37</i>	<i>GPR39</i>	<i>GPR50</i>
<i>GPR63</i>	<i>GPR65</i>	<i>GPR68</i>	<i>GPR75</i>	<i>GPR84</i>	<i>GPR87</i>	<i>GPR88</i>	<i>GPR132</i>
<i>GPR149</i>	<i>GPR161</i>	<i>GPR183</i>	<i>LGR4</i>	<i>LGR5</i>	<i>LGR6</i>	<i>MAS1</i>	<i>MRGPRD</i>
<i>MRGPRX1</i>	<i>MRGPRX2</i>	<i>P2RY10</i>	<i>TAAR2</i>				

In addition the orphan receptors *GPR18*, *GPR55* and *GPR119* which are reported to respond to endogenous agents analogous to the endogenous cannabinoid ligands have been grouped together (*GPR18*, *GPR55* and *GPR119*).

Nomenclature	<i>GPR1</i>	<i>GPR3</i>
HGNC, UniProt	<i>GPR1</i> , P46091	<i>GPR3</i> , P46089
Endogenous agonists	chemerin (<i>RARRES2</i> , Q99969) [101]	–
Agonists	–	diphenylethiodonium chloride [2179]

(continued)			
Nomenclature	GPR1	GPR3	
Comments	Reported to act as a co-receptor for HIV [1791]. See review [414] for discussion of pairing with chemerin. sphingosine 1-phosphate was reported to be an endogenous agonist [1997], but this finding was not replicated in subsequent studies [2182]. Reported to activate adenylyl cyclase constitutively through G _s [494]. Gene disruption results in premature ovarian ageing [1128], reduced β-amyloid deposition [1943] and hypersensitivity to thermal pain [1689] in mice. First small molecule inverse agonist [903] and agonists identified [2179].		

Nomenclature	GPR4	GPR6	GPR42
HGNC, UniProt	GPR4 , P46093	GPR6 , P46095	GPR42 , O15529
Endogenous ligands	Protons	–	–
Comments	An initial report suggesting activation by lysophosphatidylcholine and sphingosylphosphorylcholine [2225] has been retracted [1470]. GPR4, GPR65, GPR68 and GPR132 are now thought to function as proton-sensing receptors detecting acidic pH [414, 1775]. Gene disruption is associated with increased perinatal mortality and impaired vascular proliferation [2173]. Negative allosteric modulators of GPR4 have been reported [1967]. An initial report that sphingosine 1-phosphate (S1P) was a high-affinity ligand (EC ₅₀ value of 39nM) [855, 1997] was not repeated in arrestin-based assays [1854, 2182]. Reported to activate adenylyl cyclase constitutively through G _s and to be located intracellularly [1521]. GPR6-deficient mice showed reduced striatal cyclic AMP production <i>in vitro</i> and selected alterations in instrumental conditioning <i>in vivo</i> . [1200].		

Nomenclature	GPR12	GPR15	GPR17
HGNC, UniProt	GPR12 , P47775	GPR15 , P49685	GPR17 , Q13304
Endogenous agonists	–	–	UDP-glucose [134, 359], LTC ₄ [359], UDP-galactose [134, 359], uridine diphosphate [134, 359], LTD ₄ [359]
Comments	Reports that sphingosine 1-phosphate is a ligand of GPR12 [854, 1997] have not been replicated in arrestin-based assays [1854, 2182]. Gene disruption results in dyslipidemia and obesity [158]. Reported to act as a co-receptor for HIV [490]. In an infection-induced colitis model, <i>Gpr15</i> knockout mice were more prone to tissue damage and inflammatory cytokine expression [991]. Reported to be a dual leukotriene and uridine diphosphate receptor [359]. Another group instead proposed that GPR17 functions as a negative regulator of the CysLT ₁ receptor response to leukotriene D ₄ (LTD ₄). For further discussion, see [414]. Reported to antagonize CysLT ₁ receptor signalling <i>in vivo</i> and <i>in vitro</i> [1239]. See reviews [258] and [414].		

Nomenclature	GPR19	GPR20	GPR21	GPR22	GPR25	GPR26	GPR27
HGNC, UniProt	GPR19, Q15760	GPR20, Q99678	GPR21, Q99679	GPR22, Q99680	GPR25, O00155	GPR26, Q8NDV2	GPR27, Q9NS67
Comments	– Reported to inhibit adenylyl cyclase constitutively through <i>G_{i/o}</i> [743]. GPR20 deficient mice exhibit hyperactivity characterised by increased total distance travelled in an open field test [213].		<i>Gpr21</i> knockout mice were resistant to diet-induced obesity, exhibiting an increase in glucose tolerance and insulin sensitivity, as well as a modest lean phenotype [1516].		– Gene disruption results in increased severity of functional decompensation following aortic banding [110]. Identified as a susceptibility locus for osteoarthritis [520, 975, 2011].	– Has been reported to activate adenylyl cyclase constitutively through <i>G_s</i> [923]. <i>Gpr26</i> knockout mice show increased levels of anxiety and depression-like behaviours [2209].	Knockdown of <i>Gpr27</i> reduces endogenous mouse insulin promoter activity and glucose-stimulated insulin secretion [1059].

Nomenclature	GPR31	GPR32	GPR33	GPR34
HGNC, UniProt	GPR31, O00270	GPR32, O75388	GPR33, Q49SQ1	GPR34, Q9UPC5
Potency order of endogenous ligands	–	resolvin D1 > <i>LXA₄</i>	–	–
Endogenous agonists	12S-HETE [700] – Mouse	resolvin D1 [1052], <i>LXA₄</i> [1052]	–	lysophosphatidylserine [1008, 1891]
Labelled ligands	–	[³ H]resolvin D1 (Agonist) [1052]	–	–
Comments	See [414] for discussion of pairing.		GPR33 is a pseudogene in most individuals, containing a premature stop codon within the coding sequence of the second intracellular loop [1696].	
			Lysophosphatidylserine has been reported to be a ligand of GPR34 in several publications, but the pairing was not replicated in a recent study based on arrestin recruitment [1854]. Fails to respond to a variety of lipid-derived agents [2182]. Gene disruption results in an enhanced immune response [1168]. Characterization of agonists at this receptor is discussed in [859] and [414].	

Nomenclature	GPR35		GPR37
HCNC, UniProt	GPR35 , Q9HC97		GPR37 , O15354
Endogenous agonists	2-oleoyl-LPA [1503], kynurenic acid [1854, 2066]		–
Agonists	–		neuropeptide head activator [1652]
Comments	Several studies have shown that kynurenic acid is an agonist of GPR35 but it remains controversial whether the proposed endogenous ligand reaches sufficient tissue concentrations to activate the receptor [1061]. 2-oleoyl-LPA has also been proposed as an endogenous ligand [1503] but these results were not replicated in an arrestin assay [1854]. The phosphodiesterase inhibitor zaprinast [1937] has become widely used as a surrogate agonist to investigate GPR35 pharmacology and signalling [1937]. GPR35 is also activated by the pharmaceutical adjunct pamoic acid [2218]. See reviews [414] and [453].		Reported to associate and regulate the dopamine transporter [1269] and to be a substrate for parkin [1267]. Gene disruption results in altered striatal signalling [1268]. The peptides prosapide and prosaposin are proposed as endogenous ligands for GPR37 and GPR37L1 [1324].

Nomenclature	GPR37L1	GPR39	GPR45	GPR50
HCNC, UniProt	GPR37L1 , O60883	GPR39 , O43194	GPR45 , Q9YSY3	GPR50 , Q13585
Endogenous agonists	–	Zn²⁺ [813]	–	–
Comments	The peptides prosapide and prosaposin are proposed as endogenous ligands for GPR37 and GPR37L1 [1324]. Zn²⁺ has been reported to be a potent and efficacious agonist of human, mouse and rat GPR39 [2176]. obestatin (GHRL , Q9UBU3), a fragment from the ghrelin precursor, was reported initially as an endogenous ligand, but subsequent studies failed to reproduce these findings. GPR39 has been reported to be down-regulated in adipose tissue in obesity-related diabetes [285]. Gene disruption results in obesity and altered adipocyte metabolism [1567]. Reviewed in [414]. GPR50 is structurally related to MT ₁ and MT ₂ melatonin receptors, with which it heterodimerises constitutively and specifically [1155]. Gpr50 knockout mice display abnormal thermoregulation and are much more likely than wild-type mice to enter fasting-induced torpor [117].			

Nomenclature	GPR52	GPR61	GPR62	GPR63	GPR65
HCNC, UniProt	GPR52 , Q9Y2T5	GPR61 , Q9BZ18	GPR62 , Q9BZ17	GPR63 , Q9BZ16	GPR65 , Q81YL9
Endogenous ligands	–	–	–	–	Protons

(continued)					
Nomenclature	GPR52	GPR61	GPR62	GPR63	GPR65
Comments	First small molecule agonist reported [1774].	GPR61 deficient mice exhibit obesity associated with hyperphagia [1422]. Although no endogenous ligands have been identified, 5-(non)oxy)tryptamine has been reported to be a low affinity inverse agonist [1925].	–	sphingosine 1-phosphate and dioleoylphosphatidic acid have been reported to be low affinity agonists for GPR63 [1459] but this finding was not replicated in an arrestin-based assay [2182].	GPR4, GPR65, GPR68 and GPR132 are now thought to function as proton-sensing receptors detecting acidic pH [414, 1775]. Reported to activate adenylyl cyclase; gene disruption leads to reduced eosinophilia in models of allergic airway disease [1044].

Nomenclature	GPR68	GPR75	GPR78	GPR79	GPR82
HCNC, UniProt	GPR68, Q15743	GPR75, Q95800	GPR78, Q96P69	GPR79, –	GPR82, Q96P67
Endogenous ligands	Protons	–	–	–	–
Allosteric modulators	lorazepam (Positive) [838]	–	–	–	–
Comments	GPR68 was previously identified as a receptor for sphingosylphosphorylcholine (SPC) [2157], but the original publication has been retracted [2156]. GPR4, GPR65, GPR68 and GPR132 are now thought to function as proton-sensing receptors detecting acidic pH [414, 1775]. A family of 3,5-disubstituted isoxazoles were identified as agonists of GPR68 [1691].				
		CCL5 (CCL5, P13501) was reported to be an agonist of GPR75 [856], but the pairing could not be repeated in an arrestin assay [1854].	GPR78 has been reported to be constitutively active, coupled to elevated cAMP production [923].	–	Mice with <i>Gpr82</i> knockout have a lower body weight and body fat content associated with reduced food intake, decreased serum triglyceride levels, as well as higher insulin sensitivity and glucose tolerance [507].

Nomenclature	GPR83	GPR84	GPR85	GPR87	GPR88	GPR101
HCNC, UniProt	GPR83, Q9NYM4	GPR84, Q9NQ55	GPR85, P60893	GPR87, Q9BY21	GPR88, Q9GZNO	GPR101, Q96P66
Endogenous agonists	–	–	–	–	–	–
Agonists	PEN (Mouse) [655] – Mouse, Zn ²⁺ [1409] – Mouse	decanoic acid [1854, 2067], undecanoic acid [2067], lauric acid [2067]	–	LPA [1401, 1911]	–	–

(continued)						
Nomenclature	GPR83	GPR84	GPR85	GPR87	GPR88	GPR101
Comments	One isoform has been implicated in the induction of CD4(+) CD25(+) regulatory T cells (Tregs) during inflammatory immune responses [731]. The extracellular N-terminal domain is reported as an intramolecular inverse agonist [1410].	Medium chain free fatty acids with carbon chain lengths of 9-14 activate GPR84 [1901, 2067]. A surrogate ligand for GPR84, 6-n-octylaminouracil has also been proposed [1901]. See review [414] for discussion of classification. Mutational analysis and molecular modelling of GPR84 has been reported [1463].	Proposed to regulate hippocampal neurogenesis in the adult, as well as neurogenesis-dependent learning and memory [319].	–	Gene disruption results in altered striatal signalling [1203]. Small molecule agonists have been reported [151].	Mutations in GPR101 have been linked to gigantism and acromegaly [1982].

Nomenclature	GPR132	GPR135	GPR139	GPR141	GPR142	GPR146
HGNC, UniProt	GPR132 , Q9UNW8	GPR135 , Q8IZ08	GPR139 , Q6DWI6	GPR141 , Q7Z602	GPR142 , Q7Z601	GPR146 , Q96CHI
Endogenous ligands	Protons	–	–	–	–	–
Comments	GPR4, GPR65, GPR68 and GPR132 are now thought to function as proton-sensing receptors detecting acidic pH [414, 1775]. Reported to respond to lysophosphatidylcholine [934], but later retracted [2126].	–	Peptide agonists have been reported [867].	–	Small molecule agonists have been reported [1968, 2196].	Yosten <i>et al.</i> demonstrated inhibition of proinsulin C-peptide (INS, P01308)-induced stimulation of cFos expression following knockdown of GPR146 in KATO III cells, suggesting proinsulin C-peptide as an endogenous ligand of the receptor [2193].

Nomenclature	GPR148	GPR149	GPR150	GPR151	GPR152	GPR153	GPR160
HGNC, UniProt	GPR148 , Q8TDV2	GPR149 , Q86SP6	GPR150 , Q8NGU9	GPR151 , Q8TDV0	GPR152 , Q8TDI2	GPR153 , Q6NV75	GPR160 , Q9UJ42
Comments	–	Gpr149 knockout mice displayed increased fertility and enhanced ovulation, with increased levels of FSH receptor and cyclin D2 mRNA levels [491].	–	GPR151 responded to galanin with an EC ₅₀ value of 2 μ M, suggesting that the endogenous ligand shares structural features with galanin (GAL, P22466) [853].	–	–	–

Nomenclature	GPR161	GPR162	GPR171	GPR173	GPR174	GPR176	GPR182
HGNC, UniProt	GPR161 , Q8N6U8	GPR162 , Q16538	GPR171 , O14626	GPR173 , Q9NS66	GPR174 , Q9BXC1	GPR176 , Q14439	GPR182 , O15218
Endogenous agonists	–	–	–	–	lysophosphatidylserine [864]	–	–
Comments	A C-terminal truncation (deletion) mutation in Gpr161 causes congenital cataracts and neural tube defects in the vacuolated lens (v ^l) mouse mutant [1289]. The mutated receptor is associated with cataract, spina bifida and white belly spot phenotypes in mice [1039]. Gene disruption is associated with a failure of asymmetric embryonic development in zebrafish [1151].						
			GPR171 has been shown to be activated by the endogenous peptide BigLEN {Mouse}. This receptor-peptide interaction is believed to be involved in regulating feeding and metabolism responses [654].		See [859] which discusses characterization of agonists at this receptor.		Rat GPR182 was first proposed as the adrenomedullin receptor [947]. However, it was later reported that rat and human GPR182 did not respond to adrenomedullin [973] and GPR182 is not currently considered to be a genuine adrenomedullin receptor [756].

Nomenclature	GPR183	LGR4
HGNC, UniProt	GPR183 , P32249	LGR4 , Q9BXB1
Endogenous agonists	7α,25-dihydroxycholesterol [729, 1191], 7α,27-dihydroxycholesterol [1191], 7β, 25-dihydroxycholesterol [1191], 7β, 27-dihydroxycholesterol [1191]	R-spondin-2 (RSP02 , Q6UXX9) [277], R-spondin-1 (RSP01 , Q2MKAZ) [277], R-spondin-3 (RSP03 , Q9BXY4) [277], R-spondin-4 (RSP04 , Q210M5) [277]
Comments	Two independent publications have shown that 7α,25-dihydroxycholesterol is an agonist of GPR183 and have demonstrated by mass spectrometry that this oxysterol is present endogenously in tissues [729, 1191]. Gpr183-deficient mice show a reduction in the early antibody response to a T-dependent antigen. GPR183-deficient B cells fail to migrate to the outer follicle and instead stay in the follicle centre [966, 1557].	LGR4 does not couple to heterotrimeric G proteins or recruit arrestins when stimulated by the R-spondins, indicating a unique mechanism of action. R-spondins bind to LGR4, which specifically associates with Frizzled and LDL receptor-related proteins (LRPs) that are activated by the extracellular Wnt molecules and then trigger canonical Wnt signalling to increase gene expression [277, 426, 1686]. Gene disruption leads to multiple developmental disorders [911, 1219, 1849, 2092].

Nomenclature	LGR5	LGR6	MAST	MASTL
HGNC, UniProt	LGR5 , O75473	LGR6 , Q9HBX8	MAST , P04201	MASTL , P35410
Endogenous agonists	R-spondin-2 (RSPQ2, Q6UXX9) [277], R-spondin-1 (RSPQ1, Q2MK47) [277], R-spondin-3 (RSPQ3, Q9BXY4) [277], R-spondin-4 (RSPQ4, Q210M5) [277]	R-spondin-1 (RSPQ1, Q2MK47) [277, 426], R-spondin-2 (RSPQ2, Q6UXX9) [277, 426], R-spondin-3 (RSPQ3, Q9BXY4) [277, 426], R-spondin-4 (RSPQ4, Q210M5) [277, 426]	–	–
Agonists	–	–	angiotensin-(1-7) (ACT, P01019) [645] – Mouse	–
Comments	The four R-spondins can bind to LGR4, LGR5, and LGR6, which specifically associate with Frizzled and LDL receptor-related proteins (LRPs), proteins that are activated by extracellular Wnt molecules and which then trigger canonical Wnt signalling to increase gene expression [277, 426].	–	–	–

Nomenclature	MRCPRD	MRCPRE	MRCPRF	MRCPRG
HGNC, UniProt	MRCPRD , Q8TDS7	MRCPRE , Q86SM8	MRCPRF , Q96AM1	MRCPRG , Q86SM5
Endogenous agonists	β-alanine [1797, 1854]	–	–	–
Comments	An endogenous peptide with a high degree of sequence similarity to angiotensin-(1-7) (ACT, P01019) , almandine (ACT) , was shown to promote NO release in MRCPRD-transfected cells. The binding of almandine to MRCPRD to was shown to be blocked by D-Pro ⁷ -angiotensin-(1-7), β-alanine and PDI23319 [1102]. Genetic ablation of MRCPRD+ neurons of adult mice decreased behavioural sensitivity to mechanical stimuli but not to thermal stimuli [292]. See reviews [414] and [1847].	See reviews [414] and [1847].	MRCPRF has been reported to respond to stimulation by angiotensin metabolites [620]. See reviews [414] and [1847].	See reviews [414] and [1847].

Nomenclature	<i>MRCPRX1</i>	<i>MRCPRX2</i>	<i>MRCPRX3</i>	<i>MRCPRX4</i>	<i>OPN3</i>	<i>OPN4</i>	<i>OPN5</i>
HGNC, UniProt	<i>MRCPRX1</i> , <i>Q96LB2</i>	<i>MRCPRX2</i> , <i>Q96LB1</i>	<i>MRCPRX3</i> , <i>Q96LB0</i>	<i>MRCPRX4</i> , <i>Q96LA9</i>	<i>OPN3</i> , <i>Q9H1Y3</i>	<i>OPN4</i> , <i>Q9UHM6</i>	<i>OPN5</i> , <i>Q6U736</i>
Endogenous agonists	bovine adrenal medulla peptide 8-22 (<i>PENK</i> , P01210) [315, 1144, 1854]	PAMP-20 (<i>ADM</i> , P35318) [942]	–	–	–	–	–
Agonists	–	cortistatin-14 [Mouse, Rat] [942, 1667, 1854] PAMP-12 (human) [942]	–	–	–	–	–
Selective agonists	–	–	–	–	–	–	–
Comments	Reported to mediate the sensation of itch [1196, 1808]. Reports that bovine adrenal medulla peptide 8-22 (<i>PENK</i> , P01210) was the most potent of a series of proenkephalin A-derived peptides as an agonist of <i>MRCPRX1</i> in assays of calcium mobilisation and radioligand binding [1144] were replicated in an independent study using an arrestin recruitment assay [1854]. See reviews [414] and [1847].	A diverse range of substances has been reported to be agonists of <i>MRCPRX2</i> , with cortistatin 14 the highest potency agonist in assays of calcium mobilisation [1667], also confirmed in an independent study using an arrestin recruitment assay [1854]. See reviews [414] and [1847].	–	See reviews [414] and [1847].	–	–	Evidence indicates <i>OPN5</i> triggers a UV-sensitive G _i -mediated signalling pathway in mammalian tissues [1028].

Nomenclature	<i>P2RY8</i>	<i>P2RY10</i>	<i>TAAR2</i>	<i>TAAR3</i>	<i>TAAR4P</i>
HGNC, UniProt	<i>P2RY8</i> , <i>Q86VZ1</i>	<i>P2RY10</i> , O00398	<i>TAAR2</i> , <i>Q9P1P5</i>	<i>TAAR3P</i> , <i>Q9P1P4</i>	<i>TAAR4P</i> , –
Potency order of endogenous ligands	–	–	β-phenylethylamine > tryptamine [189]	–	–
Endogenous agonists	–	sphingosine 1-phosphate [1401], LPA [1401]	–	–	–
Comments	–	–	Probable pseudogene in 10–15% of Asians due to a polymorphism (rs8192646) producing a premature stop codon at amino acid 168 [414].	<i>TAAR3</i> is thought to be a pseudogene in man though functional in rodents [414].	Pseudogene in man but functional in rodents [414].

Nomenclature	TAAR5	TAAR6	TAAR8	TAAR9
HGNC, UniProt	TAAR5, O14804	TAAR6, Q96R18	TAAR8, Q969N4	TAAR9, Q96R19
Comments	Trimethylamine is reported as an agonist [2058] and 3-iodotyronamine an inverse agonist [450].			
				TAAR9 appears to be functional in most individuals but has a polymorphic premature stop codon at amino acid 61 (rs2842899) with an allele frequency of 10–30% in different populations [2023].

Class C Orphans

G protein-coupled receptors → Orphan and other 7TM receptors → Class C Orphans

Nomenclature	GPCR156	GPCR158	GPCR179	GPCRC5A	GPCRC5B	GPCRC5C	GPCRC5D	GPCRC6 receptor
HGNC, UniProt	GPCR156, Q8NFN8	GPCR158, Q5T848	GPCR179, Q6PRD1	GPCRC5A, Q8NF5	GPCRC5B, Q9NZH0	GPCRC5C, Q9NQ84	GPCRC5D, Q9NZD1	GPCRC6A, Q5T6X5
Comments	-	-	-	-	-	-	-	GPCRC6 is a related Gq-coupled receptor which responds to basic amino acids [2090].

Taste 1 receptors

G protein-coupled receptors → Orphan and other 7TM receptors → Taste 1 receptors

Overview: Whilst the taste of acid and salty foods appear to be sensed by regulation of ion channel activity, bitter, sweet and umami tastes are sensed by specialised GPCR. Two classes of taste GPCR have been identified, T1R and T2R, which are similar in sequence and structure to Class C and Class A GPCR, respectively. Activation of taste receptors appears to involve gustducin- (Gαt3) and Gα14-mediated signalling, although the precise mechanisms remain obscure. Gene disruption studies suggest the involvement of PLCβ2 [2215], TRPM5 [2215] and IP3 [802] receptors in post-receptor signalling of taste receptors. Although predominantly associated with the oral cavity, taste receptors are also located elsewhere, including further down the gastrointestinal system, in the lungs and in the brain.

Sweet/Umami T1R3 acts as an obligate partner in T1R1/T1R3 and T1R2/T1R3 heterodimers, which sense umami or sweet, respectively. T1R1/T1R3 heterodimers respond to L-glutamic acid and may be positively allosterically modulated by 5'-nucleoside monophosphates, such as 5'-GMP [1162]. T1R2/T1R3 heterodimers respond to sugars, such as sucrose, and artificial sweeteners, such as saccharin [1440].

Nomenclature	<i>TAS1R1</i>	<i>TAS1R2</i>	<i>TAS1R3</i>
HGNC, UniProt	<i>TAS1R1</i> , Q7RTX1	<i>TAS1R2</i> , Q8TE23	<i>TAS1R3</i> , Q7RTX0

Taste 2 receptors

G protein-coupled receptors → Orphan and other 7TM receptors → Taste 2 receptors

Overview: The composition and stoichiometry of bitter taste receptors is not yet established. Bitter receptors appear to separate into two groups, with very restricted ligand specificity or much broader responsiveness. For example, T2R5 responded to cycloheximide, but not 10 other bitter compounds [302], while T2R14 responded to at least eight different bitter tastants, including (-)- α -thujone and picrotoxinin [124].

Specialist database BitterDB contains additional information on bitter compounds and receptors [2113].

Nomenclature	<i>TAS2R1</i>	<i>TAS2R3</i>	<i>TAS2R4</i>	<i>TAS2R5</i>	<i>TAS2R7</i>	<i>TAS2R8</i>	<i>TAS2R9</i>

Other 7TM proteins

G protein-coupled receptors → Orphan and other 7TM receptors → Other 7TM proteins

Nomenclature	GPR107	GPR137	OR51E1	TPRA1	GPR143	GPR157
HGNC, UniProt	GPR107 , Q5VW38	GPR137 , Q96N19	OR51E1 , Q8TCB6	TPRA1 , Q86W33	GPR143 , P51810	GPR157 , Q5UAW9
Endogenous agonists	–	–	–	–	levodopa [1207]	–
Comments	GPR107 is a member of the LUSTR family of proteins found in both plants and animals, having similar topology to G protein-coupled receptors [489]					
		–	OR51E1 is a putative olfactory receptor.	TPRA1 shows no homology to known G protein-coupled receptors.	Loss-of-function mutations underlie ocular albinism type 1 [109].	GPR157 has ambiguous sequence similarities to several different GPCR families (class A, class B and the slime mould cyclic AMP receptor). Because of its distant relationship to other GPCRs, it cannot be readily classified.

5-Hydroxytryptamine receptors

G protein-coupled receptors → 5-Hydroxytryptamine receptors

Overview: 5-HT receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on 5-HT receptors [828] and subsequently revised [742]**) are, with the exception of the ionotropic 5-HT₃ class, GPCRs where the endogenous agonist is 5-hydroxytryptamine. The diversity of metabotropic 5-HT receptors is increased by alternative splicing that produces isoforms of the 5-HT_{2A} (non-functional), 5-HT_{2C} (non-functional), 5-HT₄, 5-HT₆ (non-functional) and 5-HT₇ receptors. Unique amongst the GPCRs, RNA editing produces 5-HT_{2C} receptor isoforms that differ in function, such as efficiency and specificity of coupling to G_q/11 and also pharmacology [167, 2098]. Most 5-HT receptors (except 5-HT_{1e} and 5-HT_{5b}) play specific roles mediating functional responses in different tissues (reviewed by [1625, 2037]).

Nomenclature	5-HT _{1A} receptor <i>HTT1A</i> , P08908	5-HT _{1B} receptor <i>HTT1B</i> , P28222
HGNC, UniProt		
Agonists	U92016A [1302], vilazodone (Partial agonist) [421], vortioxetine (Partial agonist) [96]	L-694,247 [671], naratriptan (Partial agonist) [1425], eletriptan [1425], frovatriptan [2158], zolmitriptan (Partial agonist) [1425], vortioxetine (Partial agonist) [96], rizatriptan (Partial agonist) [1425] CP94253 [1022]

Comments: Tabulated pK_i and K_D values refer to binding to human 5-HT receptors unless indicated otherwise. The nomenclature of 5-HT_{1B}/5-HT_{1D} receptors has been revised [742]. Only the non-rodent form of the receptor was previously called 5-HT_{1D}; the human 5-HT_{1B} receptor (tabulated) displays a different pharmacology to the rodent forms of the receptor due to Thr335 of the human sequence being replaced by Asn in rodent receptors. Wang *et al.* (2013) report X-ray structures which reveal the binding modality of **ergotamine** and **dihydroergotamine** to the 5-HT_{1B} receptor in comparison with the structure of the 5-HT_{2B} receptor [2064]. **NAS181** is a selective antagonist of the rodent 5-HT_{1B} receptor. **Fananserin** and **ketanserin** bind with high affinity to dopamine D4 and histamine H₁ receptors respectively, and **ketanserin** is a potent α₁ adrenoceptor antagonist, in addition to blocking 5-HT_{2A} receptors. **Lysergic acid (LSD)** and **ergotamine** show a strong preference for arrestin recruitment over G protein coupling at the 5-HT_{2B} receptor, with no such preference evident at 5-HT_{1B} receptors, and they also antagonise 5-HT_{7A} receptors [2047]. **DHE** (**dihydroergocryptine**), **pergolide** and **cabergoline** also show significant preference for arrestin recruitment over G protein coupling at 5-HT_{2B} receptors [2047]. The serotonin antagonist **mesulergine** was key to the discovery of the 5-HT_{2C} receptor [1546]. The human 5-HT_{5A} receptor has been claimed to couple to several signal transduction pathways when stably expressed in C6 glioma cells [1472] and electrophysiological recordings from mice and rat prefrontal cortex (layer V pyramidal neurons) demonstrate 5-HT_{5A}-elicited outward currents mediated *via* the 5-HT_{5A} receptor [660]. The human orthologue of the mouse 5-HT_{5B} receptor is non-functional due to interruption of the gene by stop codons. The 5-HT_{1E} receptor appears not to have been cloned from mouse, or rat, impeding definition of its function. In addition to the receptors listed in the table, an 'orphan' receptor, unofficially termed 5-HT_{1P}, has been described [635].

Acetylcholine receptors (muscarinic)

G protein-coupled receptors → Acetylcholine receptors (muscarinic)

Overview: Muscarinic acetylcholine receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Muscarinic Acetylcholine Receptors [288]**) are GPCRs of the Class A, rhodopsin-like family where the endogenous agonist is acetylcholine. In addition to the agents listed in the table, AC-42, its structural analogues AC-260584 and 77-LH-28-1, N-desmethylozapine, TBRP and LuAE51090 have been described as functionally selective agonists of the M1 receptor subtype via binding in a mode distinct from that utilized by non-selective agonists [74, 921, 1096, 1097, 1294, 1708, 1857, 1858, 1898]. There are two pharmacologically characterised allosteric sites on muscarinic receptors, one defined by it binding gallamine, strychnine and brucine, and the other defined by the binding of KT 5720, WIN 62,577, WIN 51,708 and staurosporine [1110, 1111].

Nomenclature	M1 receptor	M2 receptor
HGNC, UniProt	CHRM1, P11229	CHRM2, P08172
Agonists	carbachol [350, 888, 2129], pilocarpine (Partial agonist) [888], bethanechol [888]	bethanechol [888]
Antagonists	glycopyrrolate (pIC50 9.9) [1874], umeclidinium (pKi 9.8) [1090, 1705], AE9C90CB (pKi 9.7) [1818], propanteline (pKi 9.7) [837], atropine (pKi 8.5–9.6) [350, 582, 797, 837, 1555, 1831], tiotropium (pKi 9.6) [452], 4-DAMP (pKi 9.2) [486]	tiotropium (pKi 9.9) [452], umeclidinium (pKi 9.8) [1090, 1705], propanteline (pKi 9.5) [837], glycopyrrolate (Full agonist) (pIC50 9.3) [1874], atropine (pKi 7.8–9.2) [245, 325, 797, 837, 1046, 1437, 1555], AE9C90CB (pKi 8.6) [1818], tolterodine (Inverse agonist) (pKi 8.4–8.6) [642, 1437, 1818]
Selective antagonists	biperiden (pKd 9.3) [175], VU0255035 (pKi 7.8) [1786], guanylpirenzepine (pKi 7.3–7.6) [23, 2050] – Rat	tripitramine (pKi 9.6) [1240]
Allosteric modulators	muscarinic toxin 7 (Negative) (pKi 11–11.1) [1480], benzoquinazolinone 12 (Positive) (pK8 6.6) [14], KT 5720 (Positive) (pKd 6.4) [1110], brucine (Positive) (pKd 4.5–5.8) [888, 1109], BQCA (Positive) (pK8 4–4.8) [4, 5, 271, 1225], VU0029767 (Positive) [1270], VU0090157 (Positive) [1270]	W-84 (Negative) (pKd 6–7.5) [1353, 1983], C7/3-phth (Negative) (pKd 7.1) [351], alcuronium (Negative) (pKd 6.1–6.9) [888, 1983], gallamine (Negative) (pKd 5.9–6.3) [363, 1107], LY2119620 (Positive) (pKd 5.7) [399, 1057], LY2033298 (Positive) (pKd 4.4) [2009]

(continued)	
Nomenclature	M₁ receptor
Labelled ligands	M₂ receptor [³ H]QNB (Antagonist) (pK _d 10.6–10.8) [352, 1555], Cy3B-telenzepine (Antagonist) (pK _d 10.5) [777], [³ H]N-methyl scopolamine (Antagonist) (pK _d 9.4–10.3) [294, 350, 352, 797, 888, 889, 918, 977, 1107], [³ H](+)-telenzepine (Antagonist) (pK _i 9.4) [526] – Rat, Alexa-488-telenzepine (Antagonist) (pK _d 9.3) [777], [³ H]pirenzepine (Antagonist) (pK _d 7.9) [2083], BODIPY-pirenzepine (Antagonist) (pK _i 7) [860], [¹¹ C]butylthio-TZTP (Agonist) [530], [¹¹ C]xanomeline (Agonist) [530], [¹⁸ F](R,R)-quinclidinyl-4-fluoromethyl-benzilate (Antagonist) [982] – Rat

Nomenclature	M ₃ receptor	M ₄ receptor	M ₅ receptor

Antagonists	tiotropium (pK _i 9.5–11.1) [452, 469], umecidinium (pK _i 10.2) [1090, 1705], propanteline (pK _i 10) [837], AE9C90CB (pK _i 9.9) [1818], atropine (pK _i 8.9–9.8) [245, 469, 797, 837, 1555, 1831], ipratropium (pK _i 9.3–9.8) [469, 797], aclidinium (pK _{CS0} 9.8) [1601]	umecidinium (pK _i 10.3) [1705], glycopyrrolate (pK _{CS0} 9.8) [1874], AE9C90CB (pK _i 9.5) [1818], 4-DAMP (pK _i 8.9) [486], oxybutynin (pK _i 8.7) [1818], bipiden (pK _d 8.6) [175], UH-AH 37 (pK _i 8.3–8.4) [642, 2099]	umecidinium (pK _i 9.9) [1705], glycopyrrolate (pK _{CS0} 9.7) [1874], AE9C90CB (pK _i 9.5) [1818], 4-DAMP (pK _i 9) [486], tolterodine (pK _i 8.5–8.8) [642, 1818], darifenacin (pK _i 7.9–8.6) [642, 764, 797, 1818]
Selective antagonists	–	–	ML381 (pK _i 6.3) [625]
Allosteric modulators	WIN 62,577 (Positive) (pK _d 5.1) [1111], N-chloromethyl-brucine (Positive) (pK _d 3.3) [1109]	muscarinic toxin 3 (Negative) (pK _i 8.7) [918, 1512], VU0152100 (Positive) (pEC ₅₀ 6.4) [207] – Rat, VU0152099 (Positive) (pEC ₅₀ 6.4) [207] – Rat, LY2119620 (Positive) (pK _d 5.7) [399], thiochrome (Positive) (pK _d 4) [1108], LY2033298 (Positive) [301]	ML380 (Positive) (pEC ₅₀ 6.7) [627]
Selective allosteric modulators	–	–	ML375 (Negative) (pK _{CS0} 6.5) [626]
Labelled ligands	[³ H]tiotropium (Antagonist) (pK _d 10.7) [1705], [³ H]QNB (Antagonist) (pK _d 10.4) [1555], [³ H]N-methyl scopolamine (Antagonist) (pK _d 9.7–10.2) [294, 325, 797, 837, 888, 918, 977, 1107], [³ H]darifenacin (Antagonist) (pK _d 9.5) [1831]	[³ H]QNB (Antagonist) (pK _d 9.7–10.5) [352, 1555], [³ H]N-methyl scopolamine (Antagonist) (pK _d 9.9–10.2) [294, 325, 352, 797, 888, 918, 977, 1107, 1512, 2072], [³ H]acetylcholine (Agonist) [1108]	[³ H]QNB (Antagonist) (pK _d 10.2–10.7), [³ H]N-methyl scopolamine (Antagonist) (pK _d 9.3–9.7) [294, 325, 797, 918, 977, 2072]

Comments: LY2033298 and BQCA have also been shown to directly activate the M₄ and M₁ receptors, respectively, via an allosteric site [1119, 1121, 1427, 1428]. The allosteric site for galamine and strychnine on M₂ receptors can be labelled by [³H]dimethyl-W84 [1983]. MCN-A-343 is a functionally selective partial agonist that appears to interact in a bitopic mode with both the orthosteric and an allosteric site on the M₂ muscarinic receptor [2010]. THRX160209, hybrid 1 and hybrid 2, are multivalent (bitopic) ligands that also achieve selectivity for M₂ receptors by binding both to the orthosteric and a nearby allosteric site [55, 1866]. Although numerous ligands for muscarinic acetylcholine receptors have been described, relatively few selective antagonists have been described, so it is common to assess the rank order of affinity of a number of antagonists of limited selectivity (e.g. 4-DAMP, darifenacin, pirenzepine) in order to identify the involvement of particular subtypes. It should be noted that the measured affinities of antagonists (and agonists) in radioligand binding studies are sensitive to ionic strength and can increase over 10-fold at low ionic strength compared to their values at physiological ionic strengths [155].

Adenosine receptors

G protein-coupled receptors → Adenosine receptors

Overview: Adenosine receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Adenosine Receptors [569]**) are activated by the endogenous ligand adenosine (potentially inosine also at A₃ receptors). Crystal structures for the antagonist-bound [374, 876, 1198, 1765], agonist-bound [1126, 1127, 2154] and G protein-bound A_{2A} adenosine receptors [278] have been described.

Nomenclature	A ₁ receptor	A _{2A} receptor	A _{2B} receptor	A ₃ receptor
HCNC, UniProt	ADORA1, P30542	ADORA2A, P29274	ADORA2B, P29275	ADORA3, P0DM58
Sub/family-selective agonists	NECA [602, 913, 1665, 1980, 2166]	NECA [193, 451, 602, 990, 1071, 2166]	NECA [148, 193, 905, 1179, 1870, 2024, 2166]	NECA [193, 602, 883, 1707, 2025, 2166]
Selective agonists	cyclopentyladenosine [404, 428, 602, 771, 880, 913, 1665], 5-Cl-5-deoxy-(±)-ENBA [565], TCPA [150], CCPA [880, 1485]	apadenoson [1548], UK-432,097 [2154], compound 4g [374], CGS 21680 [193, 451, 602, 880, 990, 1016, 1071, 1485], regadenoson [880]	BAV 60-6583 [488]	piclidenoson [537, 592, 1016, 2025], Cl-IB-MECA [208, 883, 987], MRS5698 [1977]
Sub/family-selective antagonists	CGS 15943 (pK _i 8.5) [1513], xanthine amine congener (pK _d 7.5) [565]	CGS 15943 (pK _i 7.7-9.4) [451, 990, 1016, 1513], xanthine amine congener (pK _i 8.4-9) [451, 1016]	xanthine amine congener (pK _i 6.9-8.8) [148, 905, 906, 1016, 1179, 1870], CGS 15943 (pK _i 6-8.1) [68, 905, 906, 1016, 1513, 1870]	CGS 15943 (pK _i 7-7.9) [995, 1016, 1513, 2025], xanthine amine congener (pK _i 7-7.4) [1016, 1707, 2025]

(continued)			
Nomenclature	A ₁ receptor	A _{2A} receptor	A _{2B} receptor
Selective antagonists	PSB36 (pK _i 9.9) [6] – Rat, DPCPX (pK _i 7.4–9.2) [428, 865, 1485, 1665, 2102], deranodyline (pK _i 9) [939], WRC-0571 (pK _i 8.8) [1272], DU172 (pK _i 7.4) [649]	SCH442416 (pK _i 8.4–10.3) [1796, 1969], ZM-241385 (pK _i 8.8–9.1) [1513]	PSB-0788 (pK _i 9.4) [1192], PSB603 (pK _i 9.3) [1192], MRS1754 (pK _i 8.8) [905, 994], PSB1115 (pK _i 7.3) [757]
Allosteric modulators	PD81723 (Positive) [239]	–	–
Labelled ligands	[³ H]CCPA (Agonist) [1016, 1665], [³ H]DPCPX (Antagonist) (pK _d 8.4–9.2) [404, 537, 1016, 1513, 1665, 1980]	[³ H]ZM 241385 (Antagonist) (pK _d 8.7–9.1) [36, 600], [³ H]CGS 21680 (Agonist) [894, 2062]	[³ H]MRS1754 (Antagonist) (pK _d 9.8) [905]
			[¹²⁵ I]AB-MECA (Agonist) [1513, 2025]

Comments: Adenosine inhibits many intracellular ATP-utilising enzymes, including adenylyl cyclase (P-site). A pseudogene exists for the A_{2B} adenosine receptor (*ADORA2BP1*) with 79% identity to the A_{2B} adenosine receptor cDNA coding sequence, but which is unable to encode a functional receptor [884]. DPCPX also inhibits antagonism at A_{2B} receptors (pK_i ca. 7. [34, 1016]). Antagonists at A₃ receptors exhibit marked species differences, such that only MRS1523 and MRS1191 are selective at the rat A₃ receptor. In the absence of other adenosine receptors, [³H]DPCPX and [³H]ZM 241385 can also be used to label A_{2B} receptors (K_d ca. 30 and 60 nM respectively). [¹²⁵I]AB-MECA also binds to A₁ receptors [1016]. [³H]CGS 21680 is relatively selective for A_{2A} receptors, but may also bind to other sites in cerebral cortex [400, 914]. [³H]NECA binds to other non-receptor elements, which also recognise adenosine [1209]. XAC-BY630 has been described as a fluorescent antagonist for labelling A₁ adenosine receptors in living cells, although activity at other adenosine receptors was not examined [217].

Adhesion Class GPCRs

G protein-coupled receptors → Adhesion Class GPCRs

Overview: Adhesion GPCRs are structurally identified on the basis of a large extracellular region, similar to the Class B GPCR, but which is linked to the 7TM region by a GPCR autoproteolysis-inducing (GAIN) domain [56] containing a GPCR proteolytic site. The N-terminus often shares structural homology with proteins such as lectins and immunoglobulins, leading to the term adhesion GPCR [571, 2187]. The nomenclature of these receptors was revised in 2015 as recommended by NC-IUPHAR and the Adhesion GPCR Consortium [718].

Adrenoceptors

G protein-coupled receptors → Adrenoceptors

Overview: The nomenclature of the Adrenoceptors has been agreed by the NC-IUPHAR Subcommittee on Adrenoceptors [256], see also [789].

Adrenoceptors, α_1
 α_1 -Adrenoceptors are activated by the endogenous agonists (-)-adrenaline and (-)-noradrenaline. Phenylephrine, methoxamine and cirazoline are agonists and prazosin and cirazoline antagonists considered selective for α_1 - relative to α_2 -adrenoceptors. [3 H]prazosin and [125 I]HEAT (BE2254) are relatively selective radioligands. S(+)-niguldipine also has high affinity for L-type Ca^{2+} channels. Fluorescent derivatives of prazosin (Bodipy P1prazosin- QATP) are used to examine cellular localisation of α_1 -adrenoceptors. Selective α_1 -adrenoceptor agonists are used as nasal decongestants; antagonists to treat hypertension (doxazosin, prazosin) and benign prostatic hyperplasia (alfuzosin,

Nomenclature	α_{1A} -adrenoceptor	α_{1B} -adrenoceptor	α_{1D} -adrenoceptor

Agonists	oxymetazoline [819, 1486, 1789, 1936], phenylephrine [1936], methoxamine [1789, 1936]	phenylephrine [559, 1345]	–
Selective agonists	A61603 [559, 1017], dabuzaligron [165]	–	–
Antagonists	prazosin (inverse agonist) (pK _i 9–9.9) [303, 405, 559, 1789, 2118], doxazosin (pK _i 9.3) [724], terazosin (pK _i 8.7) [1323], phentolamine (pK _i 8.6) [1789], alfuzosin (pK _i 8.1) [787]	prazosin (inverse agonist) (pK _i 9.6–9.9) [559, 1789, 2118], tamsulosin (inverse agonist) (pK _i 9.5–9.7) [559, 1789, 2118], doxazosin (pK _i 9.1) [724], alfuzosin (pK _i 8.6) [788], terazosin (pK _i 8.6) [1323], phentolamine (pK _i 7.5) [1789]	prazosin (inverse agonist) (pK _i 9.5–10.2) [559, 1789, 2118], tamsulosin (pK _i 9.8–10.2) [559, 1789, 2118], doxazosin (pK _i 9.1) [724], terazosin (pK _i 9.1) [1323], alfuzosin (pK _i 8.4) [787], dapiprazole (pK _i 8.4) [71], phentolamine (inverse agonist) (pK _i 8.2) [1789], RS-100329 (pK _i 7.9) [2118], labetalol (pK _i 6.6) [71]

(continued)			
Nomenclature	α_1A-adrenoceptor	α_1B-adrenoceptor	α_1D-adrenoceptor
Selective antagonists	tamsulosin (pK _i 10–10.7) [303, 405, 559, 1789, 2118], silodosin (pK _i 10.4) [1789], S(+)-niguldipine (pK _i 9.1–10) [559, 1789], RS-100329 (pK _i 9.6) [2118], SNAP5089 (pK _i 8.8–9.4) [787, 1147, 2101], <i>p</i> -Data (pK _i 9.2–9.3) [1298, 1619], RS-17053 (pK _i 9.2–9.3) [303, 405, 556, 559]	Rec 15/2615 (pK _i 9.5) [1942], L-765314 (pK _i 7.7) [1537], AH 111110 (pK _i 7.5) [1724]	BMN-7378 (pK _i 8.7–9.1) [280, 2192]

Adrenoceptors, α_2

α_2 -Adrenoceptors are activated by (-)-adrenaline and with lower potency by (-)-noradrenaline. Brimonidine and talipexole are agonists and rauwolfscine and yohimbine antagonists selective for α_2 - relative to α_1 -adrenoceptors. [³H]rauwolfscine, [³H]brimonidine and [³H]RX821002 are relatively selective radioligands. There is species variation in the pharmacology of the α_{2A} -adrenoceptor. Multiple mutations of α_2 -adrenoceptors have been described, some associated with alterations in function. Presynaptic α_2 -adrenoceptors regulate many functions in the nervous system. The α_2 -adrenoceptor agonists clonidine, guanabenz and brimonidine affect central baroreflex control (hypotension and bradycardia), induce hypnotic effects and analgesia, and modulate seizure activity and platelet aggregation. Clonidine is an anti-hypertensive and counteracts opioid withdrawal.

Dexmedetomidine (also xylazine) is used as a sedative and analgesic in human and veterinary medicine with sympatholytic and anxiolytic properties. The α_2 -adrenoceptor antagonist yohimbine has been used to treat erectile dysfunction and mirtazapine as an anti-depressant. The α_{2B} subtype appears to be involved in neurotransmission in the spinal cord and α_{2C} in regulating catecholamine release from adrenal chromaffin cells.

Adrenoceptors, β

β -Adrenoceptors are activated by the endogenous agonists (**-**)-**adrenaline** and (**-**)-**noradrenaline**. Isoprenaline is selective for β -adrenoceptors relative to α_1 - and α_2 -adrenoceptors, while **propranolol** (pK_i 8.2–9.2) and **cyanopindolol** (pK_i 10.0–11.0) are relatively β_1 and β_2 adrenoceptor-selective antagonists. (**-**)-**noradrenaline**, **xamoterol** and (**-**)-**Ro 363** show selectivity for β_1 - relative to β_2 -adrenoceptors. Pharmacological differences exist between human and mouse β_3 -adrenoceptors, and the 'rodent selective' agonists **BRL 37344** and **CL316243** have low efficacy at the human β_3 -adrenoceptor whereas **CGP 12177** and **L 755507** activate human β_3 -adrenoceptors [88]. β_3 -Adrenoceptors are resistant to blockade by **propranolol**, but can be blocked by high

concentrations of **bupranolol**. **SR59230A** has reasonably high affinity at β_3 -adrenoceptors, but does not discriminate well between the three β - subtypes whereas **L 755507** is more selective. [125 I]-**cyanopindolol**, [125 I]-hydroxy benzylpindolol and [3 H]-**alprenolol** are high affinity radioligands that label β_1 - and β_2 -adrenoceptors and β_3 -adrenoceptors can be labelled with higher concentrations (nM) of [125 I]-**cyanopindolol** together with β_1 - and β_2 -adrenoceptor antagonists. [3 H]-L-748337 is a β_3 -selective radioligand [2020]. Fluorescent ligands such as BODIPY-**FM**-CGP12177 can be used to track β -adrenoceptors at the cellular level [8]. Somewhat selective β_1 -adrenoceptor agonists (**denopamine**, **dobutamine**) are used short term to treat cardiogenic shock but, chronically, reduce survival. β_1 -Adrenoceptor-preferring antagonists are used to treat hypertension (**atenolol**, **betaxolol**), **bisoprolol**, **metoprolol** and **nebivolol**), cardiac arrhythmias (**atenolol**, **bisoprolol**, **esmolol**) and cardiac failure (**metoprolol**, **nebivolol**). Cardiac failure is also treated with carvedilol that blocks β_1 - and β_2 -adrenoceptors, as well as α_1 -adrenoceptors. Short (**salbutamol**, **terbutaline**) and long (**formoterol**, **salmeterol**) acting β_2 -adrenoceptor-selective agonists are powerful bronchodilators used to treat respiratory disorders. Many first generation β -adrenoceptor antagonists (**propranolol**) block both β_1 - and β_2 -adrenoceptors and there are no β_2 -adrenoceptor-selective antagonists used therapeutically. The β_3 -adrenoceptor agonist **mirabegron** is used to control overactive bladder syndrome.

Nomenclature	β_1 -adrenoceptor	β_2 -adrenoceptor	β_3 -adrenoceptor

Labelled ligands	[¹²⁵I]CYP (Selective Antagonist) (pK _d 10.4–11.3) [870 , 1210 , 1723]	[¹²⁵I]CYP (Antagonist) (pK _d 11.1) [1210 , 1723]	[¹²⁵I]CYP (Agonist, Partial agonist) [1210 , 1355 , 1589 , 1723 , 1880]
Comments	The agonists indicated have less than two orders of magnitude selectivity [85].		
	Agonist SB251023 has a pEC ₅₀ of 6.9 for the splice variant of the mouse β ₃ receptor, β _{3a} [850].		

Comments: Adrenoceptors, α₁

The α₁C-adrenoceptor corresponds to the pharmacologically defined α_{1A}-adrenoceptor [[789](#)]. Some tissues possess α_{1A}-adrenoceptors (α_{1I}-adrenoceptors [[559](#), [1382](#)]) that display relatively low affinity in functional and binding assays for **prazosin** indicative of different receptor states or locations. α_{1A}-adrenoceptor C-terminal splice variants form homo- and heterodimers, but fail to generate a functional α_{1I}-adrenoceptor [[1628](#)]. α_{1D}-Adrenoceptors form heterodimers with α_{1B}- or β₂-adrenoceptors that show increased cell-surface expression [[1993](#)]. Recombinant α_{1D}-adrenoceptors have been shown in some heterologous systems to be mainly located intracellularly but cell-surface localization is encouraged by truncation of the N-terminus, or by co-expression of α_{1B}- or β₂-adrenoceptors [[706](#), [1993](#)]. In blood vessels all three α₁-adrenoceptor subtypes are located on the surface and intracellularly [[1320](#), [1321](#)]. Signalling is predominantly via G_{q/11} but α₁-adrenoceptors also couple to G_{12/13}. Several α_{1A}-adrenoceptor agonists display ligand directed signalling bias relative to noradrenaline [[521](#)]. There are also differences between subtypes in coupling efficiency to different pathways. In vascular smooth muscle, the potency of agonists is related to the predominant subtype, α_{1D}-conveying greater agonist sensitivity than α_{1A}-adrenoceptors [[553](#)].

Adrenoceptors, α₂

ARC-239 and **prazosin** show selectivity for α_{2B}- and α_{2C}-adrenoceptors over α_{2A}-adrenoceptors. **Oxymetazoline** is a reduced efficacy imidazoline agonist but also binds to non-GPCR binding sites for imidazolines, classified as I₁, I₂ and I₃ sites [[406](#)]; catecholamines have a low affinity, while rilmenidine and moxonidine are selective ligands evoking hypotensive effects *in vivo*.

I₁-imidazoline receptors cause central inhibition of sympathetic tone, I₂-imidazoline receptors are an allosteric binding site on monamine oxidase B, and I₃-imidazoline receptors regulate insulin secretion from pancreatic β-cells. α_{2A}-adrenoceptor stimulation reduces insulin secretion from β-islets [[2171](#)], with a polymorphism in the 5'-UTR of the ADRA2A gene being associated with increased receptor expression in β-islets and heightened susceptibility to diabetes [[1673](#)]. α_{2A}- and α_{2C}-adrenoceptors form homodimers [[1829](#)]. Heterodimers between α_{2A}- and either the α_{2C}-adrenoceptor or μ opioid peptide receptor exhibit altered signalling and trafficking properties compared to the individual receptors [[1829](#), [1931](#), [2036](#)]. Signalling by α₂-adrenoceptors is primarily via G_{12/13}, although the α_{2A}-adrenoceptor also couples to G_s [[487](#)]. Imidazoline compounds display bias relative to each other at the α_{2A}-adrenoceptor [[1544](#)]. The noradrenaline reuptake inhibitor desipramine acts directly on the α_{2A}-adrenoceptor to promote internalisation *via* recruitment of arrestin [[385](#)].

Adrenoceptors, β

[¹²⁵I]CYP can be used to define β₁- or β₂-adrenoceptors when conducted in the presence of a β₁- or β₂-adrenoceptor-selective antagonist. A fluorescent analogue of **CGP 12177** can be used to study β₂-adrenoceptors in living cells [[88](#)]. **[¹²⁵I]CYP** at higher (nM) concentrations can be used to label β₃-adrenoceptors in systems with few if any other β-adrenoceptor subtypes. The β₃-adrenoceptor has an intron in the coding region, but splice variants have only been described for the mouse [[522](#)], where the isoforms display different signalling characteristics [[850](#)]. There are 3 β-adrenoceptors in turkey (termed the tβ, tβ3c and tβ4c) that have a pharmacology that differs from the human β-adrenoceptors [[86](#)]. Numerous polymorphisms have been

described for the β-adrenoceptors; some are associated with signalling and trafficking, altered susceptibility to disease and/or altered responses to pharmacotherapy [[1169](#)]. All β-adrenoceptors couple to G_s (activating adenylyl cyclase and elevating cAMP levels), but also activate G_i and β-arrestin-mediated signalling. Many β₁- and β₂-adrenoceptor antagonists are agonists at β₃-adrenoceptors (**CL316243**, **CGP 12177** and **carazolol**). Many 'antagonists' of cAMP accumulation, for example **carvedilol** and **bucindolol**, weakly activate MAP kinase pathways [[89](#), [523](#), [589](#), [590](#), [1721](#), [1722](#)] and thus display 'protein agonism'. **Bupranolol** acts as a neutral antagonist in most systems so far examined. Agonists also display biased signalling at the β₂-adrenoceptor via G_s or arrestins [[470](#)]. X-ray crystal structures have been described of the agonist bound [[2075](#)] and antagonist bound forms of the β₁-[[2076](#)] agonist-bound [[328](#)] and antagonist-bound forms of the β₂-adrenoceptor [[1632](#), [1672](#)], as well as a fully active agonist-bound, G_s protein-coupled β₂-adrenoceptor [[1633](#)]. **Carvedilol** and **bucindolol** bind to a site on the β₁-adrenoceptor involving contacts in TM2, 3, and 7 and extracellular loop 2 that may facilitate coupling to arrestins [[2076](#)]. Compounds displaying arrestin-biased signalling at the β₂-adrenoceptor have a greater effect on the conformation of TM7, whereas full agonists for G_s coupling promote movement of TM5 and TM6 [[1192](#)]. Recent studies using NMR spectroscopy demonstrate significant conformational flexibility in the β₂-adrenoceptor that is stabilized by both agonist and G proteins highlighting the dynamic nature of interactions with both ligand and downstream signalling partners [[992](#), [1260](#), [1479](#)]. Such flexibility likely has consequences for our understanding of biased agonism, and for the future therapeutic exploitation of this phenomenon.

Angiotensin receptors

G protein-coupled receptors → Angiotensin receptors

Overview: The actions of angiotensin II (AGT, P01019) (Ang II) are mediated by AT₁ and AT₂ receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Angiotensin receptors** [423, 950]), which have around 30% sequence similarity. The decapeptide angiotensin I (AGT, P01019), the octapeptide angiotensin II (AGT, P01019) and the heptapeptide angiotensin III (AGT, P01019) are endogenous ligands. Losartan, candesartan, telmisartan, etc. are clinically used AT₁ receptor blockers.

Nomenclature	AT ₁ receptor	AT ₂ receptor
HCNC, UniProt	ACTR1, P30556	ACTR2, P50052

Selective agonists	L-162,313 [1559]	–
Antagonists	telmisartan (pIC ₅₀ 8.4) [1303], olmesartan (pIC ₅₀ 8.1) [1027]	–
Selective antagonists	candesartan (pIC ₅₀ 9.5–9.7) [2021], EXP3174 (pIC ₅₀ 7.4–9.5) [1965, 2021], eprosartan (pIC ₅₀ 8.4–8.8) [492], irbesartan (pIC ₅₀ 8.7–8.8) [2021], losartan (pIC ₅₀ 7.4–8.7) [425, 1965], valsartan (pIC ₅₀ 8.6) [424], azilsartan (pIC ₅₀ 8.1–8.1) [1623, 1917]	PD123177 (pIC ₅₀ 8.5–9.5) [305, 336, 478] – Rat, EMA401 (pIC ₅₀ 8.5–9.3) [543, 1656, 1836], PD123319 (pK _d 8.7–9.2) [425, 477, 2115] [1 ²⁵]CGP42112 (Agonist) [425, 2105, 2106]
Labelled ligands	[³ H]A81988 (Antagonist) (pK _d 9.2) [725] – Rat, [³ H]158809 (Antagonist) (pK _d 9.2) [320] – Rat, [³ H]eprosartan (Antagonist) (pK _d 9.1) [22] – Rat, [³ H]valsartan (Antagonist) (pIC ₅₀ 8.8–9) [2034], [¹²⁵]EXP985 (Antagonist) (pK _d 8.8) [337] – Rat, [³ H]losartan (Antagonist) (pK _d 8.2) [309] – Rat	–
Comments	telmisartan and candesartan are also reported to be agonists of PPAR γ [1877].	–

Comments: AT₁ receptors are predominantly coupled to G_q/11, however they are also linked to arrestin recruitment and stimulate G protein-independent arrestin signalling [1221]. Most species express a single *AGTRL* gene, but two related *agtr1a* and *agtr1b* receptor genes are expressed in rodents. The AT₂ receptor counteracts several of the growth responses initiated by the AT₁ receptors. The AT₂ receptor is much less abundant than the AT₁ receptor in adult tissues and is upregulated in pathological conditions. AT₁ receptor antagonists bearing substituted 4-phenylquinoline moieties have been synthesized, which bind to AT₁ receptors with nanomolar affinity and are slightly more potent than losartan in functional studies [275]. The antagonist activity of CGP42112 at the AT₂ receptor has also been reported [1469]. The AT₁ and bradykinin B₂ receptors have been proposed to form a heterodimeric complex [3]. There is also evidence for an AT₄ receptor that specifically binds angiotensin IV (*AGT*, P01019) and is located in the brain and kidney. An additional putative endogenous ligand for the AT₄ receptor has been described (LVV-hemorphin (*HBB*, P68871), a globin decapeptide) [1351].

Apelin receptor

G protein-coupled receptors → Apelin receptor

Overview: The apelin receptor (**nomenclature as agreed by the NC-IUPHAR Subcommittee on the apelin receptor [1582]**) responds to apelin, a 36 amino-acid peptide derived initially from bovine stomach. Apelin-36 (*APLN*, Q9ULZ1), apelin-13 (*APLN*, Q9ULZ1) and [Pyr¹]apelin-13 (*APLN*, Q9ULZ1) are the predominant endogenous ligands which are cleaved from a 77 amino-acid precursor peptide (*APLN*, Q9ULZ1) by a so far unidentified enzymatic pathway [1938]. A second family of peptides described independently and named Elabeta [338] or Toddler, that has little sequence similarity to apelin, has been proposed as a second endogenous apelin receptor ligand [1542]. Structure-activity relationship Elabeta analogues have been described [1406].

Nomenclature	apelin receptor
HGNC, UniProt	<i>APLN</i> , P35414
Potency order of endogenous ligands	[Pyr ¹]apelin-13 (<i>APLN</i> , Q9ULZ1) ≥ apelin-13 (<i>APLN</i> , Q9ULZ1) > apelin-36 (<i>APLN</i> , Q9ULZ1) [529, 1938]
Endogenous agonists	apelin-13 (<i>APLN</i> , Q9ULZ1) [529, 824, 1315], apelin receptor early endogenous ligand (<i>APELA</i> , P0DMC3) [436], apelin-17 (<i>APLN</i> , Q9ULZ1) [496, 1315], [Pyr ¹]apelin-13 (<i>APLN</i> , Q9ULZ1) [961, 1315], Elabeta/Toddler-21 (<i>APELA</i> , P0DMC3) [2174], Elabeta/Toddler-32 (<i>APELA</i> , P0DMC3) [2174], apelin-36 (<i>APLN</i> , Q9ULZ1) [529, 824, 961, 1315], Elabeta/Toddler-11 (<i>APELA</i> , P0DMC3) [2174]
Selective agonists	CMF-019 (Biased agonist) [1639], MM07 (Biased agonist) [209]
Antagonists	MM54 (pK _i 8.2) [1227]
Labelled ligands	[¹²⁵ I]Nle ⁷⁵ -Tyr ⁷⁷]apelin-36 (human) (Agonist) [961], [¹²⁵ I]Glp ⁶⁵ Nle ⁷⁵ -Tyr ⁷⁷]apelin-13 (Agonist) [824], [¹²⁵ I](Pyr ¹)apelin-13 (Agonist) [955], [¹²⁵]apelin-13 (Agonist) [529], [³ H](Pyr ¹)[Met(O ¹)]-apelin-13 (Agonist) [1315]

Comments: Potency order determined for heterologously expressed human apelin receptor (pD₂ values range from 9.5 to 8.6). The apelin receptor may also act as a co-receptor with CD4 for isolates of human immunodeficiency virus, with apelin blocking this function [293]. A modified apelin-13 peptide, [apelin-13QF13A](#) was reported to block the hypotensive response to apelin in rat *in vivo* [132], however, this peptide exhibits agonist activity in HEK293 cells stably expressing the recombinant apelin receptor [529].

Bile acid receptor

[G protein-coupled receptors](#) → [Bile acid receptor](#)

Overview: The bile acid receptor (GPBA) responds to bile acids produced during the liver metabolism of [cholesterol](#). Selective agonists are promising drugs for the treatment of metabolic disorders, such as type II diabetes, obesity and atherosclerosis.

Nomenclature	GPBA receptor
HGNC, UniProt	<i>GPBAR1</i> , Q8TDU6
Potency order of endogenous ligands	lithocholic acid > deoxycholic acid > chenodeoxycholic acid, cholic acid [960, 1278]
Selective agonists	S-EMCA [1550] – Mouse, betulinic acid [621], oleanolic acid [1720]

Comments: The triterpenoid natural product [betulinic acid](#) has also been reported to inhibit inflammatory signalling through the NFκB pathway [1916]. Disruption of GPBA expression is reported to protect from cholesterol gallstone formation [2031]. A new series of 5-phenoxy-1,3-dimethyl-1H-pyrazole-4-carboxamides have been reported as highly potent agonists [1204].

Bombesin receptors

G protein-coupled receptors → Bombesin receptors

Overview: Mammalian bombesin (Bn) receptors comprise 3 subtypes: BB₁, BB₂, BB₃ (**nomenclature recommended by the NC-IUPHAR Subcommittee on bombesin receptors, [900]**). BB₁ and BB₂ are activated by the endogenous ligands **gastrin-releasing peptide** (GRP, P07492) (GRP), **neuromedin B** (NMB, P08949) (NMB) and **GRP-(18-27)** (GRP, P07492) (previously named neuromedin C). Bombesin is a tetradecapeptide, originally derived from amphibians. The three Bn receptor subtypes couple primarily to the G_{q/11} and G_{12/13} family of G proteins [900] (but see also [908, 1995]). Each of these receptors is widely distributed in the CNS and peripheral tissues [659, 900, 1590, 1626, 1626, 1715, 1715, 2208]. Activation of BB₁ and BB₂ receptors causes a wide range of physiological actions, including the stimulation of normal and neoplastic tissue growth, smooth-muscle contraction, appetite and feeding behavior, secretion and many central nervous system effects [900, 901, 902, 1248, 1371, 1626, 1626].

A physiological role for the BB₃ receptor has yet to be fully defined although recently studies using receptor knockout mice and newly described agonists/antagonists suggest an important role in glucose and insulin regulation, metabolic homeostasis, feeding, regulation of body temperature and other CNS behaviors, obesity, diabetes mellitus and growth of normal/neoplastic tissues [659, 1249, 1249, 1496, 1496, 2145].

Nomenclature	BB ₁ receptor	BB ₂ receptor	BB ₃ receptor
HGNC, UniProt	NMBR, P28336	GRPR, P30550	BR53, P32247
Endogenous agonists	neuromedin B (NMB, P08949) [900, 1626, 1995]	neuromedin C [1995], gastrin releasing peptide(1-4-27) (human) [1995]	–
Selective agonists	–	–	compound 8a [1194], compound 9g [1284], MK-7725 [339], MK-5046 [1375, 1759], [D-Tyr ⁶ ,Apa-4Cl ¹¹ ,Phe ¹³ ,Nle ¹⁴]bombesin-(6-14) [1263], compound 17c [1283], compound 9f [1284], bag-1 [692], compound 22e [761], bag-2 [692]
Antagonists	D-Nal-Cys-Tyr-D-Trp-Lys-Val-Cys-Nal-NH ₂ (pIC ₅₀ 6.2–6.6) [658]	–	–
Selective antagonists	PD 176252 (pIC ₅₀ 9.3–9.8) [658], PD 168368 (pIC ₅₀ 9.3–9.6) [658], dNal-cyc(Cys-Tyr-dTrp-Orn-Val)-Nal-NH ₂	[D-Phe ⁶ ,Leu ¹³ ,Cpa ¹⁴ ,ψ ¹³⁻¹⁴]bombesin-(6-14) (pK _i 9.8) [658], JMV641 (pIC ₅₀ 9.3) [1970] – Mouse, [(3-Ph-P ⁶),His ⁷ ,D-Ala ¹¹ ,D-Pro ¹³ ,ψ ¹³⁻¹⁴ ,Phe ¹⁴]bombesin-(6-14) (pIC ₅₀ 9.2) [658, 1125], JMV594 (pIC ₅₀ 8.9) [1199, 1970] – Mouse, [D-Trp ⁶ ,Leu ¹³ ,ψ(CH ₂ NH)-Leu ¹⁴]bombesin-(6-14) (pIC ₅₀ 8.9) [658], Ac-GRP-(20-26)-methyl ester (pIC ₅₀ 8.7) [658]	bantag-1 (pIC ₅₀ 8.6–8.7) [692, 1375], ML-18 (pIC ₅₀ 5.3) [1370]
Labelled ligands	[¹²⁵ I]BH-NMB (human, mouse, rat) (Agonist), [¹²⁵ I][Tyr ⁴]bombesin (Agonist)	[¹²⁵ I][D-Tyr ⁶]bombesin-(6-13)-methyl ester (Selective Antagonist) (pK _d 9.3) [1262] – Mouse, [¹²⁵ I][Tyr ⁴]bombesin (Agonist) [135], [¹²⁵ I]GRP (human) (Agonist)	[³ H]bag-2 (Agonist) [692] – Mouse, [¹²⁵ I][D-Tyr ⁶ ,β-Ala ¹¹ ,Phe ¹³ ,Nle ¹⁴]bombesin-(6-14) (Agonist) [1264, 1375]

Comments: All three human subtypes may be activated by [D-Phe⁶,β-Ala¹¹,Phe¹³,Nle¹⁴]bombesin-(6-14) [1264]. [D-Tyr⁶,Apa-4Cl¹¹,Phe¹³,Nle¹⁴]bombesin-(6-14) has more than 200-fold selectivity for BB₃ receptors over BB₁ and BB₂ [1263, 1264, 1626, 1627].

Bradykinin receptors

G protein-coupled receptors → Bradykinin receptors

Overview: Bradykinin (or kinin) receptors **nomenclature as agreed by the NC-IUPHAR subcommittee on Bradykinin (kinin) Receptors [11361]** are activated by the endogenous peptides bradykinin (*KNG1*, P01042) (BK), [des-Arg⁹]bradykinin (*KNG1*, P01042), Lys-BK (kallidin (*KNG1*, P01042)), [des-Arg¹⁰]kallidin (*KNG1*, P01042), T-kinin (*KNG1*, P01042) (Ile-Ser-BK), [Hyp³]bradykinin (*KNG1*, P01042) and Lys-[Hyp³]bradykinin (*KNG1*, P01042). The variation in affinity or inactivity of B₂ receptor antagonists could reflect the existence of species homologues of B₂ receptors.

Nomenclature	B ₁ receptor	B ₂ receptor
HGNC, UniProt	<i>BDKRB1</i> , P46663	<i>BDKRB2</i> , P30411
Potency order of endogenous ligands	[des-Arg ¹⁰]kallidin (<i>KNG1</i> , P01042) > [des-Arg ⁹]bradykinin (<i>KNG1</i> , P01042) = kallidin (<i>KNG1</i> , P01042) > bradykinin (<i>KNG1</i> , P01042)	kallidin (<i>KNG1</i> , P01042) > bradykinin (<i>KNG1</i> , P01042) >> [des-Arg ⁹]bradykinin (<i>KNG1</i> , P01042), [des-Arg ¹⁰]kallidin (<i>KNG1</i> , P01042)

Calcitonin receptors

G protein-coupled receptors → Calcitonin receptors

Overview: This receptor family comprises a group of receptors for the calcitonin/CGRP family of peptides. The calcitonin (CT), amylin (AMY), calcitonin gene-related peptide (CGRP) and adrenomedullin (AM) receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on CGRP, AM, AMY, and CT receptors [755, 1600]**) are generated by the genes *CALCR* (which codes for the CT receptor) and *CALCRL* (which codes for the calcitonin receptor-like receptor, CLR, previously known as CRLR). Their function and pharmacology are altered in the presence of RAMMs (receptor activity-modifying proteins), which are single TM domain proteins of ca. 130 amino acids, identified as a family of three members; RAMP1, RAMP2 and RAMP3. There are splice variants of the CT receptor; these in turn produce variants of the AMY receptor [1600], some of which can be potentially activated by CGRP. The endogenous agonists are the peptides **calcitonin** (*CALCA*, P01258), **α -CGRP** (*CALCB*, P06881) (formerly known as CGRP-1), **β -CGRP** (*CALCB*, P10092) (formerly known as CGRP-1), **amylin** (*APP*, P10997) (occasionally called islet-amyloid polypeptide, diabetes-associated polypeptide), **adrenomedullin** (*ADM*, P35318) and **adrenomedullin 2/intermedin** (*ADM2*, Q7Z4H4). There are species differences in peptide sequences, particularly for the CTs. **CTR-stimulating peptide** [Pig] (CRSP) is another member of the family with selectivity for the CT receptor but it is not expressed in humans [952]. **Olecegepant** (also known as BIBN4096BS, pK_i 10.5) and **telcagepant** (also known as MK0974, pK_i 9) are the most selective antagonists available, showing selectivity for CGRP receptors, with a particular preference for those of primate origin. CLR (calcitonin receptor-like receptor) by itself binds no known endogenous ligand, but in the presence of RAMPs it gives receptors for CGRP, adrenomedullin and adrenomedullin 2/intermedin.

Nomenclature	CT receptor	AMY ₁ receptor	AMY ₂ receptor	AMY ₃ receptor
HGNC, UniProt	<i>CALCR</i> , P30988	–	–	–

Labelled ligands	–	[¹²⁵ I] α CGRP (human) (Agonist), [¹²⁵ I] α CGRP (mouse, rat) (Agonist)	[¹²⁵ I]AM (rat) (Agonist)	[¹²⁵ I]AM (rat) (Agonist)

Comments: It is important to note that a complication with the interpretation of pharmacological studies with AMY receptors in transfected cells is that most of this work has likely used a mixed population of receptors, encompassing RAMP-coupled CTR as well as CTR alone. This means that although in binding assays human **calcitonin** ([CALCA](#), [P01258](#)) has low affinity for ¹²⁵I-AMY binding sites, cells transfected with CTR and RAMPs can display potent CTR functional responses. Transfection of human CTR with any RAMP can generate receptors with a high affinity for both salmon CT and AMY and varying affinity for different antagonists [[353](#), [752](#), [753](#)]. The major human CTR splice variant (hCT_{1(a)}) which does not contain an insert with RAMP1 (*i.e.* the AMY_{1(a)} receptor) has a high affinity for CGRP [[2057](#)], unlike hCT_{1(a)}-RAMP3 (*i.e.* AMY_{3(a)} receptor) [[353](#), [752](#)]. Actions of CGRP at AMY (and the AM2) receptors led to proposals for a CGRP2 receptor in early literature [[755](#)]. However, the AMY receptor phenotype is RAMP-type, splice variant and cell-line-dependent [[1376](#), [1614](#), [1964](#)].

The ligands described have limited selectivity. Adrenomedullin has appreciable affinity for CGRP receptors. CGRP can show significant cross-reactivity at AMY receptors and AM₂ receptors. Adrenomedullin 2/intermedin also has high affinity for the AM₂ receptor [[818](#)]. CGRP-(8-37) acts as an antagonist of CGRP (p*K*_i ~8) and inhibits some AM and AMY responses (p*K*_i ~6–7). It is weak at CT receptors. Human AM-(22-52) has some selectivity towards AM receptors, but with modest potency (p*K*_i ~7), limiting its use [[754](#)]. Olcegepant shows the greatest selectivity between receptors but still has significant affinity for AMY₁ receptors [[2057](#)]. G_s is a prominent route for effector coupling for CLR and CTR but other pathways (*e.g.* Ca²⁺, ERK, Akt), and G proteins can be activated [[2056](#)]. There is evidence that CGRP-RCP (a 148 amino-acid hydrophilic protein, [ASL](#) ([P04424](#))) is important for the coupling of CLR to adenylyl cyclase [[524](#)].

[¹²⁵I]-Salmon CT is the most common radioligand for CTR receptors but it has high affinity for AMY receptors and is also poorly reversible. [¹²⁵I]-Tyr⁰-CGRP is widely used as a radioligand for CGRP receptors.

Calcium-sensing receptor

G protein-coupled receptors → Calcium-sensing receptor

Overview: The calcium-sensing receptor (CaS, **provisional nomenclature as recommended by NC-IUPHAR [557]**) responds to multiple endogenous ligands, including extracellular calcium and other divalent/trivalent cations, polyamines and polycationic peptides, L-amino acids (particularly L-Trp and L-Phe), glutathione and various peptide analogues, ionic strength and extracellular pH (reviewed in [1122]). While divalent/trivalent cations, polyamines and polycations are CaS receptor agonists [234, 1618], L-amino acids, glutamyl peptides, ionic strength and pH are allosteric modulators of agonist function [375, 557, 803, 1616, 1617]. Indeed, L-amino acids have been identified as "co-agonists", with both concomitant calcium and

L-amino acid binding required for full receptor activation [623, 2205]. The sensitivity of the CaS receptor to primary agonists is increased by elevated extracellular pH [270] or decreased extracellular ionic strength [1617]. This receptor bears no sequence or structural relation to the plant calcium receptor, also called CaS.

Nomenclature	CaS receptor
HGNC, UniProt	CASR, P41180
Amino-acid rank order of potency	L-phenylalanine, L-tryptophan, L-histidine > L-alanine > L-serine, L-proline, L-glutamic acid > L-aspartic acid (not L-lysine, L-arginine, L-leucine and L-isoleucine) [375]
Cation rank order of potency	Cd ³⁺ > Ca ²⁺ > Mg ²⁺ [234]
Glutamyl peptide rank order of potency	S-methylglutathione ≈ γGlu-Val-Gly > glutathione > γGlu-Cys [226, 1498, 2068]
Polyamine rank order of potency	spermine > spermidine > putrescine [1618]
Allosteric modulators	ATF 936 (Negative) (pIC ₅₀ 8.9) [2109], encalret (Negative) (pIC ₅₀ 7.9) [1795], SB-423562 (Negative) (pIC ₅₀ 6.5–6.8) [92], NPS 2143 (Negative) (pK _B 6.2–6.7) [418, 1120, 1123], cinacalcet (Positive) (pK _B 5.9–6.6) [378, 418, 1120, 1123], tecalcet (Positive) (pK _B 6.2–6.6) [378, 418], AC265347 (Positive) (pK _B 6.3–6.4) [378, 1120], calhex 231 (Negative) (pIC ₅₀ 6.4) [1569], calindol (Positive) (pK _B 6.3) [378]

Comments: The CaS receptor has a number of physiological functions, but it is best known for its central role in parathyroid and renal regulation of extracellular calcium homeostasis [728]. This is seen most clearly in patients with loss-of-function CaS receptor mutations who develop familial hypocalcaemic hypercalcaemia (heterozygous mutations) or neonatal severe hyperparathyroidism (heterozygous, compound heterozygous or homozygous mutations) [728] and in CaS null mice [307, 803], which exhibit similar increases in PTH secretion and blood calcium levels. Gain-of-function CaS mutations are associated with autosomal dominant hypocalcaemia and Bartter syndrome type V [728].

The CaS receptor primarily couples to G_{q/11}, G_{12/13} and G_{i/o} [418, 634, 836, 1954], but in some cell types can couple to G_s [1258]. However, the CaS receptor can form heteromers with Class C GABAB [308, 327] and mGluR/5 receptors [595], which may introduce further complexity in its signalling capabilities.

Multiple other small molecule chemotypes are positive and negative allosteric modulators of the CaS receptor [980, 1441]. Further, **etelcalcetide** is a novel peptide agonist of the receptor [2059]. Agonists and positive allosteric modulators of the CaS receptor are termed Type I and II calcimimetics, respectively, and can suppress

parathyroid hormone (PTH (PTH, P01270)) secretion [1443]. Negative allosteric modulators are called calcilytics and can act to increase PTH (PTH, P01270) secretion [1442].

Where functional pK_B values are provided for allosteric modulators, this refers to ligand affinity determined in an assay that measures a functional readout of receptor activity (*i.e.* a receptor signalling assay), as opposed to affinity determined in a radioligand binding assay. The functional pK_B may differ depending on the signalling pathway studied. Consult the 'More detailed page' for the assay description, as well as other functional readouts.

Cannabinoid receptors

G protein-coupled receptors → Cannabinoid receptors

Overview: Cannabinoid receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Cannabinoid Receptors [1564]**) are activated by endogenous ligands that include N-arachidonyl ethanolamine (anandamide), N-homo-γ-linolenylethanolamine, N-docosatetra-7,10,13,16-enylethanolamine and 2-arachidonoylglycerol. Potency determinations of endogenous agonists at these receptors are complicated by the possibility of differential susceptibility of endogenous ligands to enzymatic conversion [35]. There are currently three licenced cannabinoid medicines each of which contains a compound that can activate CB₁ and CB₂ receptors [1562]. Two of these medicines were developed to suppress nausea and vomiting produced by chemotherapy. These are **nabilone** (Cesamet®), a synthetic CB₁/CB₂ receptor agonist, and synthetic **Δ⁹-tetrahydrocannabinol** (Marinol®; dronabinol), which can also be used as an appetite stimulant. The third medicine, Sativex®, contains mainly **Δ⁹-tetrahydrocannabinol** and **cannabidiol**, both extracted from cannabis, and is used to treat multiple sclerosis and cancer pain.

Nomenclature	CB ₁ receptor	CB ₂ receptor
HGNC, UniProt	CNR1, P21554	CNR2, P34972
Agonists	cannabinol (Partial agonist) [535, 1801]	–
Sub/family-selective agonists	HU-210 [535, 1801], CP55940 [535, 1676, 1801], WIN55212-2 [535, 1798, 1801], Δ ⁹ -tetrahydrocannabinol (Partial agonist) [535, 1801]	HU-210 [535, 1653, 1801], WIN55212-2 [535, 1798, 1801], CP55940 [535, 1676, 1801], Δ ⁹ -tetrahydrocannabinol (Partial agonist) [113, 535, 1653, 1801]
Selective agonists	arachidonyl-2-chloroethylamide [791] – Rat, arachidonylcyclopropylamide [791] – Rat, O-1812 [443] – Rat, R-(+)-methanandamide [976] – Rat	[WH-133 [844, 1563], L-759,633 [607, 1676], AM1241 [2175], L-759,656 [607, 1676], HU-308 [734]
Selective antagonists	rimonabant (pK _i 7.9–8.7) [534, 535, 1660, 1687, 1801], AM251 (pK _i 8.1) [1094] – Rat, AM281 (pK _i 7.9) [1093] – Rat, LY320135 (pK _i 6.9) [534]	SR144528 (pK _i 8.3–9.2) [1661, 1676], AM-630 (pK _i 7.5) [1676]
Allosteric modulators	GAT100 (Negative) (pEC ₅₀ 7.7) [1070], ZCZ011 (Positive) (pEC ₅₀ 6.3) [857] – Mouse, cannabidiol (Negative) [1100]	–
Labelled ligands	[³ H]rimonabant (Antagonist) (pK _d 8.9–10) [211, 799, 932, 1568, 1662, 1811, 1948] – Rat	–

Comments: Both CB₁ and CB₂ receptors may be labelled with [³H]GCP55940 (0.5 nM; [1801]) and [³H]WIN55212-2 (2–2.4 nM; [1826, 1852]). Anandamide is also an agonist at vanilloid receptors (TRPV1) and PPARs [1484]. There is evidence for an allosteric site on the CB₁ receptor [1603]. All of the compounds listed as antagonists behave as inverse agonists in some bioassay systems [1564]. Fosome cannabinoid receptor ligands, additional pharmacological targets that include GPR55 and GPR119 have been identified [1564]. Moreover, GPR18, GPR55 and GPR119, although showing little structural similarity to CB₁ and CB₂ receptors, respond to endogenous agents that are structurally similar to the endogenous cannabinoid ligands [1564].

Chemerin receptor

G protein-coupled receptors → Chemerin receptor

Overview: The chemerin receptor (**nomenclature as recommended by NC-IUPHAR [414]**) is activated by the lipid-derived, anti-inflammatory ligand **resolvin E1** (RvE1), which is the result of sequential metabolism of **EPA** by aspirin-modified cyclooxygenase and lipoxygenase [60, 61]. In addition, two GPCRs for **resolvin D1** (RvD1) have been identified, FPR2/ALX, the lipoxin A₄ receptor, and GPR32, an orphan receptor [1052].

Nomenclature	chemerin receptor
HGNC, UniProt	CMKLR1, Q99788
Potency order of endogenous ligands	resolvin E1 > chemerin C-terminal peptide > 18R-HEPE > EPA [60]
Selective agonists	resolvin E1
Labelled ligands	[³ H]resolvin E1 (Agonist) [60, 61]

Comments: CCX832 (structure not disclosed) is a selective antagonist, pK_i=9.2 [969].

Chemokine receptors

G protein-coupled receptors → Chemokine receptors

Overview: Chemokine receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Chemokine Receptors** [81, 1402, 1403]) comprise a large subfamily of 7TM proteins that bind one or more chemokines, a large family of small cytokines typically possessing chemotactic activity for leukocytes. Chemokine receptors can be divided by function into two main groups: G protein-coupled chemokine receptors, which mediate leukocyte trafficking, and "Atypical chemokine receptors", which may signal through non-G protein-coupled mechanisms and act as chemokine scavengers to downregulate inflammation or shape chemokine gradients [81].

Chemokines in turn can be divided by structure into four subclasses by the number and arrangement of conserved cysteines. CC (also known as β -chemokines; $n=28$), CXC (also known as α -chemokines; $n=17$) and CX3C ($n=1$) chemokines all have four conserved cysteines, with zero, one and three amino acids separating the first two cysteines respectively. C chemokines ($n=2$) have only the second and fourth cysteines found in other chemokines. Chemokines can also be classified by function into homeostatic and inflammatory subgroups. Most chemokine receptors are able to bind multiple high-affinity chemokine ligands, but the ligands for a given receptor are almost always restricted to the same structural subclass. Most chemokines bind to more than one receptor subtype. Receptors for inflammatory chemokines are typically highly promiscuous with regard to ligand specificity, and may lack a selective endogenous ligand. G protein-coupled chemokine receptors are named according to the class of chemokines bound, whereas ACKR is the root acronym for atypical chemokine receptors [82].

Listed are those human agonists with EC_{50} values <50 nM in either Ca^{2+} flux or chemotaxis assays at human recombinant G protein-coupled chemokine receptors expressed in mammalian cell lines. There can be substantial cross-species differences in the sequences of both chemokines and chemokine receptors, and in the pharmacology and biology of chemokine receptors. Endogenous and microbial non-chemokine ligands have also been identified for chemokine receptors. Many chemokine receptors function as HIV co-receptors, but CCR5 is the only one demonstrated to play an essential role in HIV/AIDS pathogenesis. The tables include both standard chemokine receptor names [2191] and aliases. Numerical data quoted are typically pK_i or pIC_{50} values from radioligand binding to heterologously expressed receptors.

Nomenclature	CCR1	CCR2	CCR3

Nomenclature	XCRI	ACKR1	ACKR2	ACKR3	ACKR4	CCR2
HCNC, UnIProt	XCRI , P46094	ACKR1 , Q16570	ACKR2 , O00590	ACKR3 , P25106	ACKR4 , Q9NPB9	CCR2 , O00421
Endogenous ligands	–	CXCL5 (CXCL5 , P42830), CXCL6 (CXCL6 , P80162), CXCL8 (CXCL8 , P10145), CXCL11 (CXCL11 , O14625), CCL2 (CCL2 , P13500), CCL5 (CCL5 , P13501), CCL7 (CCL7 , P80098), CCL11 (CCL11 , P51671), CCL14 (CCL14 , Q16627), CCL17 (CCL17 , Q92583)	–	–	–	chemerin C-terminal peptide, CCL19 (CCL19 , Q99731) [101]
Endogenous agonists	XCL1 (XCL1 , P47992) [564], XCL2 (XCL2 , Q9UBD3) [564]	–	CCL2 (CCL2 , P13500), CCL3 (CCL3 , P10147), CCL4 (CCL4 , P13236), CCL5 (CCL5 , P13501), CCL7 (CCL7 , P80098), CCL8 (CCL8 , P80075), CCL11 (CCL11 , P51671), CCL13 (CCL13 , Q99616), CCL14 (CCL14 , Q16627), CCL17 (CCL17 , Q92583), CCL22 (CCL22 , O00626)	CXCL12α (CXCL12 , P48061) [674 , 1854], CXCL11 (CXCL11 , O14625)	CCL19 (CCL19 , Q99731) [2085], CCL25 (CCL25 , O15444) [2085], CCL21 (CCL21 , O00585) [2085]	–
Comments	XCL1 cannot be iodinated, but a secreted alkaline phosphatase (SEAP)-XCL1 fusion peptide can be used as a probe at XCRI.	ACKR1 is used by <i>Plasmodium vivax</i> and <i>Plasmodium knowlesi</i> for entering erythrocytes.	–	Several lines of evidence have suggested that adrenomedullin is a ligand for ACKR3; however, classical direct binding to the receptor has not yet been convincingly demonstrated.	–	–

Comments: Specific chemokine receptors facilitate cell entry by microbes, such as ACKR1 for *Plasmodium vivax* and CCR5 and CXCR4 for HIV-1. Virally encoded chemokine receptors are known (e.g. US28, a homologue of CCR1 from human cytomegalovirus and ORF74, which encodes a homolog of CXCR2 in *Hepesvirus saimiri* and gamma-Herpesvirus-68), but their role in viral life cycles is not established. Viruses can exploit or subvert the chemokine system by producing chemokine antagonists and scavengers. Two chemokine receptor antagonists have now been approved by the FDA: the CCR5 antagonist [maraviroc](#) (Pfizer) for treatment of HIV/AIDS in patients with CCR5-using strains; and the CXCR4 antagonist [plerixafor](#) (Sanoofi) for hematopoietic stem cell mobilization with [G-CSF](#) ([CSF3](#), [P09919](#)) in patients undergoing transplantation in the context of chemotherapy for Hodgkins' Disease and multiple myeloma.

Cholecystokinin receptors

G protein-coupled receptors → Cholecystokinin receptors

Overview: Cholecystokinin receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on CCK receptors [1471]**) are activated by the endogenous peptides cholecystokinin-8 (CCK-8 (CCK, P06307)), CCK-33 (CCK, P06307), CCK-58 (CCK, P06307) and gastrin (gastrin-17 (GAST, P01350)). There are only two distinct subtypes of CCK receptors, CCK₁ and CCK₂, with some alternatively spliced forms most often identified in neoplastic cells. The CCK receptor subtypes are distinguished by their peptide selectivity, with the CCK₁ receptor requiring the carboxyl-terminal heptapeptide-amide that includes a sulfated tyrosine for high affinity and potency, while the CCK₂ receptor requires only the carboxyl-terminal tetrapeptide shared by each CCK and gastrin peptides. These receptors have characteristic and distinct distributions, with both present in both the central nervous system and peripheral tissues.

Nomenclature	CCK ₁ receptor	CCK ₂ receptor
HGNC, UniProt	CCKAR, P32238	CCKBR, P32239
Potency order of endogenous ligands	CCK-8 (CCK, P06307) ≫ gastrin-17 (GAST, P01350), desulfated cholecystokinin-8 > CCK-4 (CCK, P06307)	CCK-8 (CCK, P06307) ≧ gastrin-17 (GAST, P01350), desulfated cholecystokinin-8, CCK-4 (CCK, P06307)
Endogenous agonists	–	desulfated cholecystokinin-8 [1135], gastrin-17 (GAST, P01350) [845] – Mouse, CCK-4 (CCK, P06307) [871], desulfated gastrin-14 (GAST, P01350), desulfated gastrin-17 (GAST, P01350), desulfated gastrin-34 (GAST, P01350), desulfated gastrin-71 (GAST, P01350), gastrin-14 (GAST, P01350), gastrin-34 (GAST, P01350), gastrin-71 (GAST, P01350)
Selective agonists	A-71623 [67] – Rat, JMW180 [971], GW-5823 [772]	RB-400 [129] – Rat, PBC-264 [886] – Rat
Antagonists	linitript (pIC ₅₀ 8.3) [667]	–
Selective antagonists	devazepide (pIC ₅₀ 9.7) [845] – Rat, T-0632 (pIC ₅₀ 9.6) [1935] – Rat, PD-140548 (pIC ₅₀ 8.6) [1817] – Rat, lorglumide (pIC ₅₀ 6.7–8.2) [845, 875] – Rat	YF-476 (pIC ₅₀ 9.7) [201, 1927], GVI50013 (pIC ₅₀ 9.4) [2006], L-740093 (pIC ₅₀ 9.2) [1464], YM-022 (pIC ₅₀ 9.2) [1464], INJ-26070109 (pIC ₅₀ 8.5) [1390], L-365260 (pIC ₅₀ 8.4) [1135], RP73870 (pIC ₅₀ 8) [1181] – Rat, LY262691 (pIC ₅₀ 7.5) [1632] – Rat
Labelled ligands	[³ H]devazepide (Antagonist) (pK _d 9.7) [306], [¹²⁵ I]DTyr-Gly-(Nle28,31)CCK-26-33 (Agonist) [1599]	[³ H]PDI40376 (Antagonist) (pK _i 9.7–10) [849] – Guinea pig, [¹²⁵ I]PDI42308 (Antagonist) (pK _d 9.6) [820] – Guinea pig, [¹²⁵ I]DTyr-Gly-(Nle28,31)CCK-26-33 (Agonist) [1599], [¹²⁵ I]gastrin (Agonist), [³ H]gastrin (Agonist), [³ H]L365260 (Antagonist) (pK _d 8.2–8.5) [1464], [¹²⁵ I]-BDZ ₂ (Antagonist) (pK _i 8.4) [25]

Comments: While a cancer-specific CCK receptor has been postulated to exist, which also might be responsive to incompletely processed forms of CCK (Gly-extended forms), this has never been isolated. An alternatively spliced form of the CCK₂ receptor in which intron 4 is retained, adding 69 amino acids to the intracellular loop 3 (ICL3) region, has been described to be present particularly in certain neoplasms where mRNA mis-splicing has been commonly observed [1833], but it is not clear that this receptor splice form plays a special role in carcinogenesis. Another alternative splicing event for the CCK₂ receptor was reported [1850], with alternative donor sites in exon 4 resulting in long (452 amino acids) and short (447 amino acids) forms of the receptor differing by five residues in ICL3, however, no clear functional differences have been observed.

Class Frizzled GPCRs

G protein-coupled receptors → Class Frizzled GPCRs

Overview: Receptors of the Class Frizzled (FZD, **nomenclature as agreed by the NC-IUPHAR subcommittee on the Class Frizzled GPCRs [1747]**), are GPCRs originally identified in *Drosophila* [300], which are highly conserved across species. While SMO shows structural resemblance to the 10 FZDs, it is functionally separated as it mediates effects in the Hedgehog signalling pathway [1747]. FZDs are activated by WNTs, which are cysteine-rich lipoglycoproteins with fundamental functions in ontogeny and tissue homeostasis. FZD signalling was initially divided into two pathways, being either dependent on the accumulation of the transcription regulator **β-catenin** (*CTNNB1*, *P35222*) or being **β-catenin-independent** (often referred to as canonical vs. non-canonical WNT/FZD signalling, respectively). WNT stimulation of FZDs can, in cooperation with the low density lipoprotein receptors *LRP5* (*O75197*) and *LRP6* (*O75581*), lead to the inhibition of a constitutively active destruction complex, which results in the accumulation of **β-catenin** and subsequently its translocation to the nucleus. **β-Catenin**, in turn, modifies gene transcription by interacting with TCF/LEF transcription factors. **β-Catenin-independent** FZD signalling is far more complex with regard to the diversity of the activated pathways. WNT/FZD signalling can lead to the activation of heterotrimeric G proteins [447], the elevation of intracellular calcium [1828], activation of cGMP-specific PDE6 [19] and elevation of cAMP as well as RAC-1, JNK, Rho and Rho kinase signalling [730]. Furthermore, the phosphoprotein Dishevelled constitutes a key player in WNT/FZD signalling. As with other GPCRs, members of the Frizzled family are functionally dependent on the arrestin scaffolding protein for internalization [321], as well as for **β-catenin-dependent** [242] and **β-catenin-independent** [243, 986] signalling. The pattern of cell signalling is complicated by the presence of additional ligands, which can enhance or inhibit FZD signalling (secreted Frizzled-related proteins (sFRP), **Wnt-inhibitory factor** (*WIF1*, *Q9Y5W5*) (*WIF*), **sclerostin** (*SOST*, *Q9BOB4*) or Dickkopf (DKK)), as well as modulatory (co)-receptors with **Ryk**, **ROR1**, **ROR2** and Kremen, which may also function as independent signalling proteins.

Nomenclature	FZD ₁	FZD ₂	FZD ₃	FZD ₄	FZD ₅	FZD ₆	FZD ₇
HGNC, UniProt	FZD1, Q9UP38	FZD2, Q14332	FZD3, Q9NPG1	FZD4, Q9ULV1	FZD5, Q13467	FZD6, O60353	FZD7, O75084

Nomenclature	FZD ₈	FZD ₉	FZD ₁₀	SMO
HCNC, UniProt	FZD8, Q9H461	FZD9, O00144	FZD10, Q9ULW2	SMO, Q99835
Antagonists	–	–	–	saridegib (pIC ₅₀ 8.9) [1981], glasdegib (pIC ₅₀ 8.3) [1398], sonidegib (pK _i 8.2) [2065]
Selective antagonists	–	–	–	vismodegib (pK _i 7.8) [2065]

Comments: There is limited knowledge about WNT/FZD specificity and which molecular entities determine the signalling outcome of a specific WNT/FZD pair. Understanding of the coupling to G proteins is incomplete (see [447]). There is also a scarcity of information on basic pharmacological characteristics of FZDs, such as binding constants, ligand specificity or concentration-response relationships [984].

Ligands associated with FZD signalling

WNTs: *Wnt-1* (WNT1, P04628), *Wnt-2* (WNT2, P09544) (also known as *Int-1*-related protein), *Wnt-2b* (WNT2B, Q93097) (also known as WNT-13), *Wnt-3* (WNT3, P56703), *Wnt-3a* (WNT3A, P56704), *Wnt-4* (WNT4, P56705), *Wnt-5a* (WNT5A, P41221), *Wnt-5b* (WNT5B, Q9H1J7), *Wnt-6* (WNT6, Q9Y6F9), *Wnt-7a* (WNT7A, O00755), *Wnt-7b* (WNT7B, P56706), *Wnt-8a* (WNT8A, Q9H1J5), *Wnt-8b* (WNT8B, Q93098), *Wnt-9a* (WNT9A, O14904) (also known as WNT-14), *Wnt-9b* (WNT9B, O14905) (also known as WNT-15 or WNT-14b), *Wnt-10a* (WNT10A, Q9GZT5), *Wnt-10b* (WNT10B, O00744) (also known as WNT-12), *Wnt-11* (WNT11, Q96014) and *Wnt-16* (WNT16, Q9UBV4).

Extracellular proteins that interact with FZDs: *nrtin* (NDP, Q00604), *R-spondin-1* (RSP1, Q2MKA7), *R-spondin-2* (RSP2, Q6UXX9), *R-spondin-3* (RSP3, Q9BXY4), *R-spondin-4* (RSP4, Q210M5), *sFRP-1* (SFRP1, Q8N474), *sFRP-2* (SFRP2, Q96HF1), *sFRP-3* (FRZB, Q92765), *sFRP-4* (SFRP4, Q6FHJ7), *sFRP-5* (SFRP5, Q6FHJ7).

Extracellular proteins that interact with WNTs or LRPs: *Dickkopf1* (DKK1, O94907), *WIF1* (Q9YSW5), *sclerostin* (SOST, Q9BOB4), *Kremen1* (KREMEN1, Q96MU8) and *Kremen2* (KREMEN2, Q8NCW0)

Small exogenous ligands: *Foxy-5* [1910], *Box-5*, *UM206* [1086], and *XWnt8* (P28026) also known as *mini-Wnt8*.

Complement peptide receptors

G protein-coupled receptors → Complement peptide receptors

Overview: Complement peptide receptors (**nomenclature as agreed by the NC-IUPHAR subcommittee on Complement peptide receptors [1015]**) are activated by the endogenous ~75 amino-acid anaphylatoxin polypeptides *C3a* (C3, P01024) and *C5a* (C5, P01031), generated upon stimulation of the complement cascade.

Nomenclature	C3a receptor	C5a ₁ receptor	C5a ₂ receptor
HQNC, UniProt	C3AR1, Q16581	C5AR1, P21730	C5AR2, Q9P296
Potency order of endogenous ligands	C3a (C3, P01024) > C5a (C5, P01031) [41]	C5a (C5, P01031), C5a des-Arg (C5) > C3a (C3, P01024) [41]	–
Endogenous agonists	–	ribosomal protein S19 (RP519, P39019) [2160]	–
Agonists	E7 [43], compound 17 [1644], compound 21 [1643], Ac-RHYPLWR [707]	N-methyl-Phe-Lys-Pro-D-Cha-Cha-D-Arg-CO ₂ H [959, 1035]	–
Selective agonists	–	–	P59 (Biased agonist) [396], P32 (Biased agonist) [396]
Antagonists	SB290157 (pIC ₅₀ 7.6) [40], compound 4 (pIC ₅₀ 5.9) [1643]	avacopan (pIC ₅₀ 9.7) [125], WS4011 (pK _i 8.7) [1893], DF2593A (pIC ₅₀ 8.3) [1380], AcPhe-Om-Pro-D-Cha-Trp-Arg (pIC ₅₀ 7.9) [2128], N-methyl-Phe-Lys-Pro-D-Cha-Trp-D-Arg-CO ₂ H (pIC ₅₀ 7.2) [1035]	–
Labelled ligands	[125]C3a (human) (Agonist) [310]	[125]C5a (human) (Agonist) [843]	[125]C5a (human) (Agonist)

Comments: SB290157 has also been reported to have agonist properties at the C3a receptor [1282]. The putative chemotactant receptor termed C5a₂ (also known as GPR77, C5L2) binds [125]C5a with no clear signalling function, but has a putative role opposing inflammatory responses [267, 599, 616]. Binding to this site may be displaced with the rank order C5a des-Arg (C5) > C5a (C5, P01031) [267, 1508] while there is controversy over the ability of C3a (C3, P01024) and C3a des Arg (C3, P01024) to compete [817, 936, 937, 1508]. C5a₂ appears to lack G protein signalling and has been termed a decoy receptor [1753]. However, C5a₂ does recruit arrestin after ligand binding, which might provide a signalling pathway for this receptor [94, 2015], and forms heteromers with C5a₁. C5a, but not C5a-des Arg, induces upregulation of heteromer formation between complement C5a receptors C5a₁ and C5a₂ [395]. There are also reports of pro-inflammatory activity of C5a₂, mediated by HMGB1, but the signalling pathway that underlies this is currently unclear (reviewed in [1161]). More recently, work in T cells has shown that C5a₁ and C5a₂ act in opposition to each other and that altering the equilibrium between the two receptors, by differential expression or production of C5a-des Arg (which favours C5a₂), can affect the final cellular response [57].

Corticotropin-releasing factor receptors

G protein-coupled receptors → Corticotropin-releasing factor receptors

Overview: Corticotropin-releasing factor (CRF, **nomenclature as agreed by the NC-IUPHAR subcommittee on Corticotropin-releasing Factor Receptors** [750]) receptors are activated by the endogenous peptides corticotropin-releasing hormone (CRH, P06850), a 41 amino-acid peptide, urocortin 1 (UCN, P55089), 40 amino-acids, urocortin 2 (UCN2, Q96RP3), 38 amino-acids and urocortin 3 (UCN3, Q969E3), 38 amino-acids. CRF₁ and CRF₂ receptors are activated non-selectively by corticotropin-releasing hormone (CRH, P06850) and urocortin 1 (UCN, P55089). Binding to CRF receptors can be conducted using [125]Tyr⁰-CRF or [125]Tyr⁰-sauvagine with K_d values of 0.1-0.4 nM. CRF₁ and CRF₂ receptors are non-selectively antagonized by α -helical CRF, D-Phe-CRF-(12-41) and astressin.

Nomenclature	CRF₁ receptor	
HGNC, UniProt	<i>CRHR1</i>, P34998	
Endogenous agonists	–	
Antagonists	SSR125543A (pK _i 8.7) [698]	
Selective antagonists	CP 154,526 (pIC ₅₀ 9.3–10.4) [1218] – Rat, DMP696 (pK _i 8.3–9) [760], NBI27914 (pK _i 8.3–9) [314], R121919 (pK _i 8.3–9) [2227], antalarmin (pK _i 8.3–9) [2087], CP376395 (pIC ₅₀ 8.3) [322] – Rat, CRA1000 (pIC ₅₀ 6.4–7.1) [298]	antisaugvine (pK _d 8.8–9.6) [412], K41498 (pK _i 9.2) [1105], K31440 (pK _i 8.7–8.8) [1697]

Comments: A CRF binding protein has been identified (*CRHRP*, P24387) to which both corticotrophin-releasing hormone (*CRH*, P06850) and urocortin 1 (*UCN*, P55089) bind with high affinities, which has been suggested to bind and inactivate circulating corticotrophin-releasing hormone (*CRH*, P06850) [1558].

Dopamine receptors

G protein-coupled receptors → Dopamine receptors

Overview: Dopamine receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Dopamine Receptors [1748]**) are commonly divided into D₁-like (D₁ and D₅) and D₂-like (D₂, D₃ and D₄) families, where the endogenous agonist is dopamine.

Nomenclature	D₁ receptor	
HGNC, UniProt	<i>DRD1</i>, P21728	
Sub/family-selective labelled ligands	[¹²⁵ I]SCH23982 (Antagonist) (pK _d 9.5) [433], [³ H]SCH-23390 (Antagonist) (pK _d 9.5) [2221]	[³ H]spiperone (Antagonist) (pK _d 10.2) [246, 805, 2219] – Rat
Endogenous agonists	dopamine [1897, 1962]	dopamine [252, 573, 1725]
Agonists	fenoldopam [1962]	rotigotine [448], cabergoline (Partial agonist) [1337], aripiprazole (Partial agonist) [2199], bromocriptine [573, 1337, 1725], ML51547 (Biased agonist) [572], ropinirole [766], apomorphine (Partial agonist) [252, 573, 1337, 1725, 1844], pramipexole [1332, 1725], benztquinamide [677]

(continued)		
Nomenclature	D ₁ receptor	D ₂ receptor
Sub/family-selective agonists	A68930 [1445], SKF-38393 (Partial agonist) [1897, 1962]	quinpirole [252, 1332, 1539, 1844, 1846, 2019]
Selective agonists	SKF-83959 (Biased agonist) [377], SKF-81297 [47] – Rat flupentixol (pK _i 7–8.4) [1897, 1962]	sumaninole [1301]
Antagonists		blonanserin (pK _i 9.9) [1487], pipotiazine (pK _i 9.7) [1845], perphenazine (pK _i 8.9–9.6) [1055, 1761], risperidone (pK _i 9.4) [64], perosiprone (pK _i 9.2) [1762], trifluoperazine (pK _i 8.9–9) [1055, 1763]
Sub/family-selective antagonists	SCH-23390 (pK _i 7.4–9.5) [1897, 1962], SKF-83566 (pK _i 9.5) [1897], ecopipam (pK _i 8.3) [1963]	haloperidol (pK _i 7.4–8.8) [573, 1230, 1332, 1844, 1963]
Selective antagonists	–	L-741,626 (pK _i 7.9–8.5) [688, 1069], domperidone (pK _i 7.9–8.4) [573, 1844], raclopride (pK _i 8) [1339], ML321 (pK _i 7) [2147, 2148]
Labelled ligands	–	[³ H]raclopride (Antagonist) (pK _d 8.9) [1081] – Rat

Nomenclature	D ₃ receptor	D ₄ receptor	D ₅ receptor
HGNC, UniProt	DRD3, P35462	DRD4, P21917	DRD5, P21918
Sub/family-selective labelled ligands	–	[³ H]spiperone (Antagonist) (pK _d 9.5) [786, 2019]	[³ H]SCH-23390 (Antagonist) (pK _d 9.2) [1654]
Endogenous agonists	dopamine [252, 573, 1725, 1846]	dopamine [2019]	dopamine [1897]
Agonists	pramipexole [1332, 1725], bromocriptine (Partial agonist) [573, 1337, 1725], ropinirole [766], apomorphine (Partial agonist) [252, 573, 1337, 1725, 1844]	apomorphine (Partial agonist) [1337]	–
Sub/family-selective agonists	quinpirole [252, 1332, 1339, 1539, 1725, 1844, 1846, 2019]	quinpirole [1337, 1539, 2019]	A68930 [1445]
Selective agonists	PD 128907 [1610, 1725]	PD168 077 (Partial agonist) [1040] – Rat, A412997 [1373] – Rat, A412997 [1373]	–
Antagonists	perospirone (pK _i 9.6) [1844], sertindole (pK _i 8–8.8) [64, 1746, 1761], prochlorperazine (pK _i 8.4) [71], (-)-sulpiride (pK _i 6.7–7.7) [573, 1844, 1934], loxapine (pK _i 7.7) [1761], domperidone (pK _i 7.1–7.6) [573, 1844], promazine (pK _i 6.8) [253]	perospirone (pK _i 10.1) [1764], sertindole (pK _i 7.8–9.1) [253, 1761, 1763, 1764], sonepiprazole (pK _i 8.9) [1739], loxapine (pK _i 8.1) [1763]	–
Sub/family-selective antagonists	haloperidol (pK _i 7.5–8.6) [573, 1782, 1844, 1963]	haloperidol (pK _i 8.7–8.8) [1088, 1782, 1963]	SCH-23390 (pK _i 7.5–9.5) [1897], SKF-83566 (pK _i 9.4) [1897], ecopipam (pK _i 8.3) [1897]
Selective antagonists	S33084 (pK _i 9.6) [1336], nafadotride (pK _i 9.5) [1726], PCO1037 (pK _i 9.2) [689], NGB 2904 (pK _i 8.8) [2143], SB 277011-A (pK _i 8) [1641], (+)-S-14297 (pK _i 6.9–7.9) [1334, 1339]	L745870 (pK _i 9.4) [1069], A-381393 (pK _i 8.8) [1420], L741742 (pK _i 8.5) [1683], ML398 (pK _i 7.4) [142]	–

(continued)			
Nomenclature	D ₃ receptor		
Selective allosteric modulators	SB269652 (Negative) (pK _i ~9) [588]	D ₄ receptor	D ₅ receptor
Labelled ligands	[³ H]spiperone (Antagonist) (pK _d 9.9) [805, 2219] – Rat, [³ H]-OH-DPAT (Agonist) [1655], [³ H]PD128907 (Agonist) [27]	–	–
		[¹²⁵ I]U750667 (Antagonist) (pK _d 9.8) [1539], [³ H]NCD941 (Antagonist) (pK _d 8.3) [1604]	[¹²⁵ I]SCH23982 (Antagonist) (pK _d 9.1)

Comments: The selectivity of many of these agents is less than two orders of magnitude. [³H]raclopride exhibits similar high affinity for D₂ and D₃ receptors (low affinity for D₄), but has been used to label D₂ receptors in the presence of a D₃-selective antagonist. [³H]-OH-DPAT has similar affinity for D₂ and D₃ receptors, but labels only D₃ receptors in the absence of divalent cations. The D₄ receptor is highly polymorphic. The pharmacological profile of the D₅ receptor is similar to, yet distinct from, that of the D₁ receptor. The splice variants of the D₂ receptor are commonly termed D_{2s} and D_{2l} (short and long). The D₄ receptor is highly polymorphic. The D₄ receptor gene encoding the D₄ receptor is highly polymorphic in humans, with allelic variations of the protein from amino acid 387 to 515.

Endothelin receptors

G protein-coupled receptors → Endothelin receptors

Overview: Endothelin receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Endothelin Receptors [413]**) are activated by the endogenous 21 amino-acid peptides endothelins 1-3 (endothelin-1 (EDN1, P05305), endothelin-2 (EDN2, P20800) and endothelin-3 (EDN3, P14138)).

Nomenclature	ET _A receptor	ET _B receptor
HGNC, UniProt	EDNRB, P25101	EDNRB, P24530
Family selective agonists	–	endothelin-1 (EDN1, P05305) = endothelin-2 (EDN2, P20800), endothelin-3 (EDN3, P14138)
Potency order of endogenous ligands	endothelin-1 (EDN1, P05305) = endothelin-2 (EDN2, P20800) > endothelin-3 (EDN3, P14138) [1242]	–
Selective agonists	–	sarafotoxin 56c [1062, 1690], BQ 3020 [1650], [Ala ^{1,3,11,15}]-ET-1 [1354], IRL 1620 [2078]

(continued)			
Nomenclature	ET _A receptor		
Sub/family-selective antagonists	SB209670 (pK _B 9.4) [502] – Rat, TAK 044 (pA ₂ 8.4) [2081] – Rat, bosentan (pA ₂ 7.2) [367] – Rat		
Selective antagonists	macientan (pIC ₅₀ 9.3) [177], sitaxsentan (pA ₂ 8) [2135], FR139317 (inverse agonist) (pIC ₅₀ 7.3–7.9) [1242], BQ123 (pA ₂ 6.9–7.4) [1242], ambisentan (pA ₂ 7.1) [178]		
Labelled ligands	[125]IPD164333 (Antagonist) (pK _d 9.6–9.8) [416], [³ H]S0139 (Antagonist) (pK _d 9.2), [125]PPD151242 (Antagonist) (pK _d 9–9.1) [417], [³ H]BQ123 (Antagonist) (pK _d 8.5) [858]		
	ET _B receptor		
	SB209670 (pK _B 9.4) [502] – Rat, TAK 044 (pA ₂ 8.4) [2081] – Rat, bosentan (pK _i 7.1) [1405]		
	A192621 (pK _d 8.1) [2043], BQ788 (pK _d 7.9–8) [1690], IRL 2500 (pK _d 7.2) [1690], Ro 46-8443 (pIC ₅₀ 7.2) [215]		
	[125]IRL1620 (Agonist) [1421], [125]BQ3020 (Agonist) [737, 1354, 1565], [125]IRAla ^{1,3,11,15} [ET-1 (Agonist) [1354]		

Comments: Splice variants of the ET_A receptor have been identified in rat pituitary cells; one of these, ET_AR-C13, appeared to show loss of function with comparable plasma membrane expression to wild type receptor [748]. Subtypes of the ET_B receptor have been proposed, although gene disruption studies in mice suggest that only a single gene product exists [1350].

G protein-coupled estrogen receptor

G protein-coupled receptors → G protein-coupled estrogen receptor

Overview: The G protein-coupled estrogen receptor (GPER, **nomenclature as agreed by the NC-IUPHAR Subcommittee on the G protein-coupled estrogen receptor [1607]**) was identified following observations of estrogen-evoked cyclic AMP signalling in breast cancer cells [65], which mirrored the differential expression of an orphan 7-transmembrane receptor GPR30 [276]. There are observations of both cell-surface and intracellular expression of the GPER receptor [1647, 1953].

Nomenclature	GPER
HGNC, UniProt	GPER1, Q99527
Agonists	raloxifene [1570] G1 [179]
Selective agonists	
Selective antagonists	G36 (pIC ₅₀ 6.8–6.9) [438], G15 (pIC ₅₀ 6.7) [437]
Labelled ligands	[³ H]17β-estradiol (Agonist) [1953]

Comments: Antagonists at the nuclear estrogen receptor, such as [fulvestrant](#), [tamoxifen](#) [540] and [raloxifene](#) [1570], as well as the flavonoid ‘phytoestrogens’ [genistein](#) and [quercetin](#) [1241], are agonists at GPER receptors. A complete review of GPER pharmacology has been recently published [1607].

Formylpeptide receptors

[G protein-coupled receptors](#) → [Formylpeptide receptors](#)

Overview: The formylpeptide receptors (**nomenclature agreed by the NC-IUPHAR Subcommittee on the formylpeptide receptor family [2180]**) respond to exogenous ligands such as the bacterial product fMet-Leu-Phe (fMLP) and endogenous ligands such as [annexin I \(ANXA1, P04083\)](#), [cathepsin G \(CTSG, P08311\)](#), amyloid β 42, serum amyloid A and [spinorphin](#), derived from β -haemoglobin (*HBB*, P68871).

Nomenclature	FPR1	FPR2/ALX	FPR3
HGNC, UniProt	<i>FPR1</i> , P21462	<i>FPR2</i> , P25090	<i>FPR3</i> , P25089
Potency order of endogenous ligands	fMet-Leu-Phe > cathepsin G (CTSG, P08311) > annexin I (ANXA1, P04083) [1118, 1895]	LXA ₄ = aspirin triggered lipoxin A4 = ATLa2 = resolvin D1 > LTD ₄ ≫ 15-deoxy-LXA ₄ ≫ fMet-Leu-Phe [365, 544, 546, 684, 1919]	–
Endogenous agonists	–	LXA ₄ [1052], resolvin D1 [1052], aspirin-triggered resolvin D1 [1051], aspirin triggered lipoxin A4	F2L (<i>HBP1</i> , Q9NRV9) [1333]
Agonists	fMet-Leu-Phe [575, 1802]	–	–
Selective agonists	–	ATLa2 [697]	–
Endogenous antagonists	spinorphin (pI _{C50} 4.3) [1165, 1404]	–	–
Antagonists	t-Boc-FLFLF (pK _i 6–6.5) [2095]	–	–
Selective antagonists	cyclosporin H (pK _i 6.1–7.1) [2095, 2167]	WRWVWW (pI _{C50} 6.6) [83], t-Boc-FLFLF (pI _{C50} 4.3–6) [574, 1867, 2061]	–
Labelled ligands	[³ H]fMet-Leu-Phe (Agonist) [1036]	[³ H]LXA ₄ (Agonist) [544, 545]	–
Comments	A FITC-conjugated fMLP analogue has been used for binding to the mouse recombinant receptor [758].	–	–

Comments: Note that the data for FPR2/ALX are also reproduced on the [leukotriene](#) receptor page.

Free fatty acid receptors

G protein-coupled receptors → Free fatty acid receptors

Overview: Free fatty acid receptors (FFA, **nomenclature** (myristic acid), C16:0 (palmitic acid), C18:1 (oleic acid), C18:2 (linoleic acid), C18:3, (α-linolenic acid), C20:4 (arachidonic acid), C20:5,n-3 (EPA) and C22:6,n-3 (docosahexaenoic acid)) activate FFA2 [231, 1117, 1465] and FFA3 [231, 1117] receptors. The crystal structure for acids. Long-chain saturated and unsaturated fatty acids (C14-0 FFA1 [223, 872, 1043] and FFA4 receptors [795, 852, 1494], while agonist bound FFA1 has been described [1862].

Nomenclature	FFA1 receptor	FFA2 receptor
HGNC, UniProt	FFAR1, O14842	FFAR2, O15552
Endogenous agonists	docosahexaenoic acid [223, 872], α-linolenic acid [223, 872, 1043], oleic acid [223, 872, 1043], myristic acid [223, 872, 1043]	propanoic acid [231, 1117, 1465, 1741], acetic acid [231, 1117, 1465, 1741], butyric acid [231, 1117, 1465, 1741], trans-2-methylcrotonic acid [1741], 1-methylcyclopropanecarboxylic acid [1741]
Selective agonists	AMG-837 [1176], compound 4 [347], TUC-770 [346], TUC-905 [345], GW9508 (Partial agonist) [222], fasiglifam [935, 1434, 1862, 1985]	compound 1 [840] – Rat
Selective antagonists	GW1100 (pIC ₅₀ 6) [222, 1875]	GLPG0974 (pIC ₅₀ 8.1) [1423, 1584], CATPB (pIC ₅₀ 6.5) [841]
Comments	Antagonist GW1100 is also an oxytocin receptor antagonist [222]. Fasiglifam, TUC-770 and GW9508 are approximately 100 fold selective for FFA1 over FFA4 [222, 346, 1434]. AMG-837 and the related analogue AM6331 have been suggested to have an allosteric mechanism of action at FFA1, with respect to the orthosteric fatty acid binding site [1176, 2153].	–

Nomenclature	FFA3 receptor	FFA4 receptor	GPR42
HCNC, UniProt	FFAR3, O14843	FFAR4, Q5NUL3	GPR42, O15529
Endogenous agonists	propanoic acid [231, 1117, 1741, 2152], butyric acid [231, 1117, 1741, 2152], 1-methylcyclopropanecarboxylic acid [1741]	α -linolenic acid [1794], myristic acid [2084], α -linolenic acid [1932] – Rat, oleic acid [2084]	–
Agonists	acetic acid [231, 1117, 1741, 2152]	–	–
Selective agonists	–	compound A [1493], TUG-891 [1794], NCC21 [1902]	–
Comments	Beta-hydroxybutyrate has been reported to antagonise FFA3 responses to short chain fatty acids [997]. A range of FFA3 selective molecules with agonist and antagonist properties, but which bind at sites distinct from the short chain fatty acid binding site (<i>i.e.</i> allosteric modulators), have recently been described [180, 839, 1226].	A wide range of both saturated and unsaturated fatty acids containing from 6 to 22 carbons have been shown to act as agonists at FFA4 [348] with a small subset listed above. Compound A [PMID 24997608] exhibits more than 1000 fold selectivity [1493], and TUG-891 50-1000 fold selectivity for FFA4 over FFA1 [1794], dependent on the assay. NCC21 exhibits approximately 15 fold selectivity for FFA4 over FFA1 [1894].	–

Comments: Short (361 amino acids) and long (377 amino acids) splice variants of human FFA4 have been reported [1372], which differ by a 16 amino acid insertion in intracellular loop 3, and exhibit differences in intracellular signalling properties in recombinant systems [2084]. The long FFA4 splice variant has not been identified in other primates or rodents to date [795, 1372]. *GPR42* was originally described as a pseudogene within the family (ENSM0025000002583), but the discovery of several polymorphisms suggests that some versions of GPR42 may be functional [1167]. *GPR84* is a structurally-unrelated G protein-coupled receptor which has been found to respond to medium chain fatty acids [2067].

GABA_B receptors

G protein-coupled receptors → GABA_B receptors

Overview: Functional GABA_B receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on GABA_B receptors** [199, 1579]) are formed from the heterodimerization of two similar 7TM subunits termed GABA_{B1} and GABA_{B2} [199, 506, 1578, 1579, 2002]. GABA_B receptors are widespread in the CNS and regulate both pre- and postsynaptic activity. The GABA_{B1} subunit, when expressed alone, binds both antagonists and agonists, but the affinity of the latter is generally 10-100-fold less than for the native receptor. Co-expression of GABA_{B1} and GABA_{B2} subunits allows transport of GABA_{B1} to the cell surface and generates a functional receptor that can couple to signal transduction pathways such as high-voltage-activated Ca²⁺ channels (Ca_v2.1, Ca_v2.2), or inwardly rectifying potassium channels (Kir3) [147, 199, 200]. The GABA_{B1} subunit harbours the GABA (orthosteric)-binding site within an extracellular domain (ECD)

venus flytrap module (VTM), whereas the GABA_{B2} subunit mediates G protein-coupled signalling [199, 622, 624, 1578]. The two subunits interact by direct allosteric coupling [1367], such that GABA_{B2} increases the affinity of GABA_{B1} for agonists and reciprocally GABA_{B1} facilitates the coupling of GABA_{B2} to G proteins [622, 1060, 1578]. GABA_{B1} and GABA_{B2} subunits assemble in a 1:1 stoichiometry by means of a coiled-coil interaction between α -helices within their carboxy-termini that masks an endoplasmic reticulum retention motif (RXRR) within the GABA_{B1} subunit but other domains of the proteins also contribute to their heteromerization [147, 250, 1578]. Recent evidence indicates that higher order assemblies of GABA_B receptor comprising dimers of heterodimers occur in recombinant expression systems and *in vivo* and that such complexes exhibit negative functional cooperativity between heterodimers [373, 1577]. Adding further complexity, KCTD (potassium channel tetramerization proteins) 8, 12, 12b and 16 associate as tetramers with the carboxy terminus of the GABA_{B2} subunit to impart altered signalling kinetics and agonist potency to the receptor complex [108, 1751, 1990] and are reviewed by [1580]. The molecular complexity of GABA_B receptors is further increased through association with trafficking and effector proteins [Schwenk et al., 2016, *Nature Neuroscience* 19(2): 233–42] and reviewed by [1576]. Four isoforms of the human GABA_{B1} subunit have been cloned. The predominant GABA_{B1a} and GABA_{B1b} isoforms, which are most prevalent in neonatal and adult brain tissue respectively, differ in their ECD sequences as a result of the use of alternative transcription initiation sites. GABA_{B1a}-containing heterodimers localise to distal axons and mediate inhibition of glutamate release in the CA3-CA1 terminals, and GABA release onto the layer 5 pyramidal neurons, whereas GABA_{B1b}-containing receptors occur within dendritic spines and mediate slow postsynaptic inhibition [1613, 2035]. Only the 1a and 1b variants are identified as components of native receptors [199]. Additional GABA_{B1} subunit isoforms have been described in rodents and humans [1130] and reviewed by [147].

Nomenclature	GABA _B receptor	
Subunits	kctd12b (Accessory protein), KCTD16 (Accessory protein), GABA _{B2} , GABA _{B1} , KCTD8 (Accessory protein)	
Agonists	CGP 44532 [581] – Rat, (-)-baclofen [581] – Rat, 3-APPA [800], baclofen [800, 2130], 3-APMPA [2130]	
Antagonists	CGP 62349 (pK _i 8.5–8.9) [800, 2130], CGP 55845 (pK _i 7.8) [2130], SCH 50911 (pK _i 5.5–6) [800, 2130], CGP 35348 (pK _i 4.4) [2130], 2-hydroxy-saclofen (pK _i 4.1) [957] – Rat	
Labelled ligands	[³ H]CGP 54626 (Antagonist) (pK _i 9.1) [922] – Rat, [³ H]CGP 62349 (Antagonist) (pK _d 9.1) [964] – Rat, [¹²⁵ I]CGP 64213 (Antagonist) (pK _d 9) [594] – Rat, [¹²⁵ I]CGP 71872 (Antagonist) (pK _d 9) [957] – Rat, [³ H](R)-(-)-baclofen (Agonist)	

Subunits

Nomenclature	GABA _{B1}	GABA _{B2}
HGNC, UniProt	GABBR1, Q9UBS5	GABBR2, O75899

Comments: Potencies of agonists and antagonists listed in the table, quantified as IC₅₀ values for the inhibition of [³H]CGP27492 binding to rat cerebral cortex membranes, are from [199, 580, 581]. Radioligand K_D values relate to binding to rat brain membranes. CGP 71872 is a photoaffinity ligand for the GABA_{B1} subunit [128]. CGP27492 (3-APPA), CGP35024 (3-APMPA) and CGP 44532 act as antagonists at human GABA_A ρ 1 receptors, with potencies in the low micromolar range [580]. In addition to the ligands listed in the table, Ca²⁺ binds to the VTM of the GABA_{B1} subunit to act as a positive allosteric modulator of GABA [594]. Synthetic positive allosteric modulators with low, or no, intrinsic activity include CGP7930, GS39783, BHF-177 [2040] and (+)-BHF [9, 147, 154, 580]. The site of action of CGP7930 and GS39783 appears to be on the heptahelical domain of the GABA_{B2} subunit [483, 1578]. In the presence of CGP7930 or GS39783, CGP 35348 and 2-hydroxy-saclofen behave as partial agonists [580]. A negative allosteric modulator of GABA_B activity has been reported [318]. Knock-out of the GABA_{B1} subunit in C57B mice causes the development of severe tonic-clonic convulsions that prove fatal within a month of birth, whereas GABA_{B1}^{-/-} BALB/c mice, although also displaying spontaneous epileptiform activity, are viable. The phenotype of the latter animals additionally includes hyperalgesia, hyperlocomotion (in a novel, but not familiar, environment), hypodopaminergia, memory impairment and behaviours indicative of anxiety [510, 2008]. A similar phenotype has been found for GABA_{B2}^{-/-} BALB/c mice [613].

Galatin receptors

G protein-coupled receptors → Galatin receptors

Overview: Galatin receptors (**provisional nomenclature as recommended by NC-IUPHAR [557]**) are activated by the endogenous peptides galatin (*GAL*, P22466) and galatin-like peptide (*GALP*, Q9UBC7). Human galatin (*GAL*, P22466) is a 30 amino-acid non-amidated peptide [525]; in other species, it is 29 amino acids long and C-terminally amidated. Amino acids 1–14 of galatin are highly conserved in mammals, birds, reptiles, amphibia and fish. Shorter peptide species (*e.g.* reported.

Nomenclature	GAL ₁ receptor	GAL ₂ receptor	GAL ₃ receptor
HCNC, UniProt	<i>GALR1</i> , P47211	<i>GALR2</i> , O43603	<i>GALR3</i> , O60755
Potency order of endogenous ligands	galatin (<i>GAL</i> , P22466) > galatin-like peptide (<i>GALP</i> , Q9UBC7) [1500]	galatin-like peptide (<i>GALP</i> , Q9UBC7) ≥ galatin (<i>GAL</i> , P22466) [1500]	galatin-like peptide (<i>GALP</i> , Q9UBC7) > galatin (<i>GAL</i> , P22466) [1095]
Agonists	–	galatin(2–29) (rat/mouse) [1526, 2069, 2070, 2071] – Rat [D-Trp ²]galatin-(1–29) [1834] – Rat M871 (pK _i 7.9) [1848]	–
Selective agonists	–	–	SNAP 398299 (pK _i 8.3) [1033, 1034, 1906], SNAP 37889 (pK _i 7.8–7.8) [1033, 1034, 1906]
Selective antagonists	2,3-dihydro-1,4-dithiin-1,1,4,4-tetroxide (p)C ₅₀ 5.6 [1758]	–	–
Selective allosteric modulators	–	CYM2503 (Positive) (pEC ₅₀ 9.2) [1213] – Rat	–
Labelled ligands	[¹²⁵ I][Ty ²⁶]galatin (human) (Agonist) [552], [¹²⁵ I][Ty ²⁶]galatin (human) (Agonist) [552]	[¹²⁵ I][Ty ²⁶]galatin (human) (Agonist) [2070] – Rat	[¹²⁵ I][Ty ²⁶]galatin (pig) (Agonist) [191, 1835]
Comments	–	The CYM2503 PAM potentiates the anticonvulsant activity of endogenous galatin in mouse seizure models [1213].	–

Comments: [galanin-\(1-11\)](#) is a high-affinity agonist at GAL_1/GAL_2 (p*K*_i 9), and [galanin\(2-11\)](#) is selective for GAL_2 and GAL_3 compared with GAL_1 [1212]. [¹²⁵I]-[Tyr²⁶]galanin binds to all three subtypes with *K*_d values generally reported to range from 0.05 to 1 nM, depending on the assay conditions used [552, 1821, 1834, 1835, 2070]. Porcine galanin-(3-29) does not bind to cloned GAL_1 , GAL_2 or GAL_3 receptors, but a receptor that is functionally activated by porcine galanin-(3-29) has been reported in pituitary and gastric smooth muscle cells [691, 2142]. Additional galanin receptor subtypes are also suggested from studies with chimeric peptides (e.g. [M15](#), [M35](#) and [M40](#)), which act as antagonists in functional assays in the cardiovascular system [2000], spinal cord [2114], locus coeruleus, hippocampus [106] and hypothalamus [107, 1142], but exhibit agonist activity at some peripheral sites [107, 691]. The chimeric peptides [M15](#), [M32](#), [M35](#), [M40](#) and [C7](#) are agonists at GAL_1 receptors expressed endogenously in Bowes human melanoma cells [1500], and at heterologously expressed recombinant GAL_1 , GAL_2 and GAL_3 receptors [552, 1834, 1835]. Recent studies have described the synthesis of a series of novel, systemically-active, galanin analogues, with modest preferential binding at the GAL_2 receptor. Specific chemical modifications to the galanin backbone increased brain levels of these peptides after i.v. injection and several of these peptides exerted a potent antidepressant-like effect in mouse models of depression [1698].

Chrelin receptor

G protein-coupled receptors → Ghrelin receptor

Overview: The ghrelin receptor (**nomenclature as agreed by the NC-IUPHAR Subcommittee for the Ghrelin receptor [415]**) is activated by a 28 amino-acid peptide originally isolated from rat stomach, where it is cleaved from a 117 amino-acid precursor ([GHLR](#), [Q9UBU3](#)). The human gene encoding the precursor peptide has 83% sequence homology to rat prepro-ghrelin, although the mature peptide from rat and human differ by only two amino acids [1285]. Alternative splicing results in the formation of a second peptide, [[des-Gln¹⁴ghrelin](#) ([GHLR](#), [Q9UBU3](#)) with equipotent biological activity [822]. A unique post-translational modification (oxygenylation of Ser³, catalysed by ghrelin O-acyltransferase ([MBOAT4](#), [Q96T53](#)) [2170] occurs in both peptides, essential for full activity in binding to ghrelin receptors in the hypothalamus and pituitary, and for the release of growth hormone from the pituitary [1029]. Structure activity studies showed the first five N-terminal amino acids to be the minimum required for binding [122], and receptor mutagenesis has indicated overlap of the ghrelin binding site with those for small molecule agonists and allosteric modulators of [ghrelin](#) ([GHLR](#), [Q9UBU3](#)) function [814]. In cell systems, the ghrelin receptor is constitutively active [815], but this is abolished by a naturally occurring mutation (A204E) that results in decreased cell surface receptor expression and is associated with familial short stature [1527].

Nomenclature	ghrelin receptor
HCNC, UniProt	GHSR , Q92847
Potency order of endogenous ligands	ghrelin (GHLR , Q9UBU3) = [des-Gln¹⁴ghrelin (GHLR , Q9UBU3) [121, 1285]
Selective antagonists	GSK1614343 (p <i>K</i> ₅₀ 8.4) [1699], GSK1614343 (p <i>K</i> ₈ 8) [1556] – Rat
Labelled ligands	[¹²⁵ I][His ⁹ ghrelin (human) (Agonist) [956], [¹²⁵ I][Tyr ⁴ ghrelin (human) (Agonist) [1394]

Comments: [des-octanoyl]ghrelin (*GHRl*, Q9UBU3) has been shown to bind (as [¹²⁵I]tyr⁴-des-octanoyl-ghrelin) and have effects in the cardiovascular system [121], which raises the possible existence of different receptor subtypes in peripheral tissues and the central nervous system. A potent inverse agonist has been identified ([D-Arg¹,D-Phe⁵,D-Trp^{7,9},Leu¹¹]substance P, pD₂ 8.3; [812]). Ulimorelin, described as a ghrelin receptor agonist (pK_i 7.8 and pD₂ 7.5 at human recombinant ghrelin receptors), has been shown to stimulate ghrelin receptor mediated food intake and gastric emptying but not elicit release of growth hormone, or modify ghrelin stimulated growth hormone release, thus pharmacologically discriminating the orexigenic and gastrointestinal actions of ghrelin (*GHRl*, Q9UBU3) from the release of growth hormone [567]. A number of selective antagonists have been reported, including peptidomimetic [1393] and non-peptide small molecules including GSK1614343 [556, 1699].

Glucagon receptor family

G protein-coupled receptors → Glucagon receptor family

Overview: The glucagon family of receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on the Glucagon receptor family [1296]**) are activated by the endogenous peptide (27-44 aa) hormones glucagon (*GCG*, P01275), glucagon-like peptide 1 (*GCG*, P01275), glucagon-like peptide 2 (*GCG*, P01275), glucose-dependent insulinotropic polypeptide (also known as gastric inhibitory polypeptide (*GIP*, P09681)), *GHRH* (*GHRH*, P01286) and secretin (*SCT*, P09683). One common precursor (*GCG*) generates glucagon (*GCG*, P01275), glucagon-like peptide 1 (*GCG*, P01275) and glucagon-like peptide 2 (*GCG*, P01275) peptides [866].

Nomenclature	GHRH receptor	GIP receptor	GLP-1 receptor
HGNC, UniProt	GHRHR, Q02643	GIPR, P48546	GLP1R, P43220
Endogenous agonists	–	gastric inhibitory polypeptide (<i>GIP</i> , P09681) [2042]	glucagon-like peptide 1-(7-36) amide (<i>GCG</i> , P01275) [927], glucagon-like peptide 1-(7-37) (<i>GCG</i> , P01275) [449] liraglutide [1020], lixisenatide [2097], WB4-24 [528]
Agonists	ll-38 [265], semmorelin	–	exendin-4 [1346], exendin-4 [927], exendin-3 (P20394) [1635] exendin-(9-39) (pK _i 8.1) [927], GLP-1-(9-36) (pIC ₅₀ 6.9) [1368] – Rat, T-0632 (pIC ₅₀ 4.7) [1961]
Selective agonists	BIM28011 [393], tesamorelin	–	
Selective antagonists	lV-1-36 (pK _i 10.1–10.4) [1733, 2026, 2027] – Rat, lV-1-38 (pK _i 10.1) [1733, 2026, 2027] – Rat	[Pro ³]GIP [615] – Mouse	[¹²⁵ I]GLP-1-(7-36)-amide (Agonist) [927], [¹²⁵ I]exendin-(9-39) (Antagonist) (pK _d 8.3) [927], [¹²⁵ I]GLP-1-(7-37) (human) (Agonist)
Labelled ligands	[¹²⁵ I]GHRH (human) (Agonist) [196] – Rat	[¹²⁵ I]GIP (human) (Agonist) [593] – Rat	

Nomenclature	GLP-2 receptor	glucagon receptor	secretin receptor
HGNC, UniProt	<i>GLP2R</i> , O95838	<i>CCGR</i> , P47871	<i>SCTR</i> , P47872
Endogenous agonists	glucagon-like peptide 2 (CGC, P01275) [1958]	glucagon (CGC, P01275) [1587]	secretin (SCT, P09683) [343]
Agonists	teduglutide [1310]	–	–
Selective antagonists	–	L-168,049 (p <i>K</i> ₅₀ 8.4) [282], adomeglivant (p <i>K</i> _i 8.2) [963, 967], des-His ¹ -[Glu ⁹]glucagon-NH ₂ (p <i>A</i> ₂ 7.2) [2004, 2005] – Rat, NNC 92-1687 (p <i>K</i> _i 5) [1234], BAY27-9955 [1566]	[C(CH ₂ NH) ^{4,5}]secretin (p <i>K</i> _i 5.3) [704]
Labelled ligands	–	[¹²⁵ I]glucagon (human, mouse, rat) (Agonist)	[¹²⁵ I](Tyr ¹⁰)secretin-27 (rat) (Agonist) [2001] – Rat

Comments: The glucagon receptor has been reported to interact with receptor activity modifying proteins (RAMPs), specifically *RAMP2*, in heterologous expression systems [349], although the physiological significance of this has yet to be established.

Glycoprotein hormone receptors

G protein-coupled receptors → Glycoprotein hormone receptors

Overview: Glycoprotein hormone receptors (**provisional nomenclature [557]**) are activated by a non-covalent heterodimeric glycoprotein made up of a common α chain (glycoprotein hormone common alpha subunit (CGA, P01215)) and a unique β chain that confers the biological specificity to FSH (CGA *FSH β* , P01215 P01225), LH (CGA *LH β* , P01215 P01229), hCG (CGA *CG β* , P01215 P01233) or TSH (CGA *TSH β* , P01215 P01222). There is binding cross-reactivity across the endogenous agonists for each of the glycoprotein hormone receptors. The deglycosylated hormones appear to exhibit reduced efficacy at these receptors [1701].

Nomenclature	FSH receptor	LH receptor	TSH receptor
HGNC, UniProt	<i>FSHR</i> , P23945	<i>LHCGR</i> , P22888	<i>TSHR</i> , P16473
Potency order of endogenous ligands	FSH (CGA <i>FSH</i> , P01215 P01225)	LH (CGA <i>LHB</i> , P01215 P01229), hCG (CGA <i>CGB</i> , P01215 P01233)	TSH (CGA <i>TSH</i> , P01215 P01222)
Endogenous agonists	FSH (CGA <i>FSH</i> , P01215 P01225)	hCG (CGA <i>CGB</i> , P01215 P01233) [907, 1411], LH (CGA <i>LHB</i> , P01215 P01229) [907, 1411]	TSH (CGA <i>TSH</i> , P01215 P01222)
Labelled ligands	[¹²⁵ I]FSH (human) (Agonist)	[¹²⁵ I]LH (Agonist), [¹²⁵ I]chorionic gonadotropin (human) (Agonist)	[¹²⁵ I]TSH (human) (Agonist)

Gonadotrophin-releasing hormone receptors

G protein-coupled receptors → Gonadotrophin-releasing hormone receptors

Overview: GnRH₁ and GnRH₂ receptors (**provisional nomenclature** [557], also called Type I and Type II GnRH receptor, respectively [1342]) have been cloned from numerous species, most of which express two or three types of GnRH receptor [1341, 1342, 1810]. GnRH I (GnRH1, P01148) (p-Glu-His-Tyr-Ser-Tyr-Gly-Leu-Arg-Pro-Gly-NH₂) is a hypothalamic decapeptide also known as luteinizing hormone-releasing hormone, gonadolibetin, luliberin, gonadorelin or simply as GnRH. It is a member of a family of similar peptides found in many species [1341, 1342, 1810] including GnRH II (GnRH2, O43555) (p-Glu-His-Tyr-Ser-His-Gly-Tyr-Tyr-Pro-Gly-NH₂ (which is also known as chicken GnRH-II). Receptors for three forms of GnRH exist in some species but only GnRH I and GnRH II and their cognate receptors have been found in mammals [1341, 1342, 1810]. GnRH₁ receptors are expressed by pituitary gonadotrophs, where they mediate the effects of GnRH on gonadotrophin hormone synthesis and secretion that underpin central control of mammalian reproduction. GnRH analogues are used in assisted reproduction and to treat steroid hormone-dependent conditions [981]. Notably, agonists cause desensitization of GnRH-stimulated gonadotrophin secretion and the consequent reduction in circulating sex steroids is exploited to treat hormone-dependent cancers of the breast, ovary and prostate [981]. GnRH1 receptors are selectively activated by GnRH I and all lack the COOH-terminal tails found in other GPCRs. GnRH₂ receptors do have COOH-terminal tails and (where tested) are selective for GnRH II over GnRH I. GnRH₂ receptors are expressed by some primates but not by humans [1377]. Phylogenetic classifications divide GnRH receptors into three [1342] or five groups [2117] and highlight examples of gene loss through evolution, with humans retaining only one ancient gene.

Nomenclature	GnRH ₁ receptor	
HCNC, UniProt	GNRHR, P30968	
Potency order of endogenous ligands	GnRH I (GNRH1, P01148) > GnRH II (GNRH2, O43555) [1342]	
Endogenous agonists	GnRH I (GNRH1, P01148) [1214], GnRH II (GNRH2, O43555) [550, 1214, 1869]	
Selective agonists	buserelin [1432], buserelin [1431], buserelin [118], leuprolide [1881], goserelin, histrelin, nafarelin	
Antagonists	itrelx (pK _i 9.5) [1664]	
Selective antagonists	cetorelix (pK _i 9.3–10) [119, 120, 1881], abarelix (pK _i 9.1–9.5) [1881], degarelix (pK _i 8.8) [2017], ganirelix	
Labelled ligands	[125]Icetorelix (Antagonist) (pK _d 9.7) [807], [125]Itriptorelin (Agonist) [435] – Rat, [125]Ibuserelin (Agonist) [1076] – Rat, [125]Ibuserelin (human, mouse, rat) (Agonist)

		trptorelix-1 [1246] – Monkey

Comments: GnRH₁ and GnRH₂ receptors couple primarily to G_{q/11} [686] but coupling to G_s and G_i is evident in some systems [1056, 1076]. GnRH₂ receptors may also mediate (net-erotrimeric) G protein-independent signalling to protein kinases [289]. There is increasing evidence for expression of GnRH receptors on hormone-dependent cancer cells where they can exert anti-proliferative and/or proapoptotic effects and mediate effects of cytotoxins conjugated to GnRH analogues [324, 741, 1174, 1732]. In some human cancer cell models GnRH II (GNRH2, O43555) is more potent than GnRH I (GNRH1, P01148), implying mediation by GnRH₂ receptors [690], but GnRH₂ receptors are not expressed by humans because the human GNRHR2 gene contains a frame shift and internal stop codon [1377]. The possibility remains that this gene generates GnRH₂ receptor-related proteins (other than the full-length receptor) that mediate responses to GnRH II (GNRH2, O43555) (see [1436]). Alternatively, evidence for multiple active GnRH receptor conformations [289, 290, 541, 1293, 1342] raises the possibility that GnRH₁ receptor-mediated proliferation inhibition in hormone-dependent cancer cells is dependent upon different conformations than effects on G_{q/11} in pituitary cells [290, 1293]. Loss-of-function mutations in the GnRH₁ receptor and deficiency of GnRH I (GNRH1, P01148) are associated with hypogonadotropic hypogonadism although some 'loss of function' mutations may actually prevent trafficking of 'functional' GnRH₁ receptors to the cell surface, as evidenced by recovery of function by nonpeptide antagonists [1124]. Human GnRH₁ receptors are poorly expressed at the cell surface because of failure to meet structural quality control criteria for endoplasmic reticulum exit [542, 1124], and this increase susceptibility to point mutations that further impair trafficking [542, 1124]. GnRH receptor signalling may require receptor oligomerisation [376, 1054].

GPR18, GPR55 and GPR119

G protein-coupled receptors → GPR18, GPR55 and GPR119

Overview: GPR18, GPR55 and GPR119 (**provisional nomenclature**), although showing little structural similarity to CB₁ and CB₂ cannabinoid receptors, respond to endogenous agents analogous to the endogenous cannabinoid ligands, as well as some natural/synthetic cannabinoid receptor ligands [1564]. Although there are multiple reports to indicate that GPR18, GPR55 and GPR119 can be activated *in vitro* by N-arachidonoylglycine, lysophosphatidylinositol and N-oleylethanolamide, respectively, there is a lack of evidence for activation by these lipid messengers *in vivo*. As such, therefore, these receptors retain their orphan status.

Nomenclature	GPR18	GPR55	GPR119
HGNC, UniProt	GPR18, Q14330	GPR55, Q9Y2T6	GPR119, Q8TDV5
Potency order of endogenous ligands	–	–	N-oleylethanolamide, N-palmitoylethanolamine > SEA (anandamide is ineffective) [1520]
Endogenous agonists	N-arachidonoylglycine [1026]	lysophosphatidylinositol [773, 1502, 1854], 2-arachidonoylglycerolphosphoinositol [1504]	N-oleylethanolamide [354, 1520, 1854], N-palmitoylethanolamine, SEA
Selective agonists	–	AM251 [773, 948, 1695]	AS1269574 [2190], PSN632408 [1520], PSN375963 [1520]
Selective antagonists	–	CID16020046 (pA ₂ 7.3) [949]	–
Comments	The pairing of N-arachidonoylglycine with GPR18 was not replicated in two studies based on arrestin assays [1854, 2182]. See [414] for discussion.	See reviews [414] and [1800].	In addition to those shown above, further small molecule agonists have been reported [722].

Comments: GPR18 failed to respond to a variety of lipid-derived agents in an *in vitro* screen [2182], but has been reported to be activated by Δ⁹-tetrahydrocannabinol [1308]. GPR55 responds to AM251 and rimonabant at micromolar concentrations, compared to their nanomolar affinity as CB₁ receptor antagonists/inverse agonists [1564]. It has been reported that lysophosphatidylinositol acts at other sites in addition to GPR55 [2164]. N-Arachidonoylserine has been suggested to act as a low efficacy agonist/antagonist at GPR18 *in vitro* [1306]. It has also been suggested oleoyl-lysophosphatidylcholine acts, at least

Histamine receptors

G protein-coupled receptors → Histamine receptors

Overview: Histamine receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Histamine Receptors [790, 1528]**) are activated by the endogenous ligand **histamine**. Marked species differences exist between histamine receptor orthologues [790]. The human and rat H₃ receptor genes are subject to significant splice variance [91]. The potency order of histamine at histamine receptor subtypes is H₃ = H₄ > H₂ > H₁ [1528]. Some agonists at the human H₃ receptor display significant ligand bias [1659]. Antagonists of all 4 histamine receptors have clinical uses: H₁ antagonists for allergies (e.g. cetirizine), H₂ antagonists for acid-reflux diseases (e.g. ranitidine), H₃ antagonists for narcolepsy (e.g. pitolisant/WAKIX; Registered) and H₄ antagonists for atopic dermatitis (e.g. ZPL-3893787; Phase IIa) [1528].

Nomenclature	H ₁ receptor	H ₂ receptor	H ₃ receptor	H ₄ receptor
HCNC, UniProt	<i>HRH1</i> , P35367	<i>HRH2</i> , P25021	<i>HRH3</i> , Q9Y5N1	<i>HRH4</i> , Q9H3N8
Selective agonists	methyhistaprofilen [1766], histaprofilen [1173]	anthamine [1048]	immethridine [1011], methimepip [1010], MK-0249 (inverse agonist) [1413]	clobenpropit (Partial agonist) [517, 1173, 1188, 1189, 1389], 4-methylhistamine [617, 1173], ST-1006 [1528], VUF 8430 [1172]
Antagonists	cypiroheptadine (pK _i 10.2) [1352], promethazine (pK _i 9.6) [636], pyrilamine (inverse agonist) (pK _i 8.7–9) [188, 1634], cetirizine (inverse agonist) (pK _i 8.2) [1352], diphenhydramine (pK _i 7.9) [188]	–	iodophenpropit (pK _i 8.2–8.7) [2112, 2139]	–
Sub/family-selective antagonists	–	–	thioperamide (Selective for H ₃ /H ₄ compared to H ₁ and H ₃ .) (pK _i 7.1–7.7) [368, 516, 517, 1170, 1211, 2112, 2139]	thioperamide (Selective for H ₃ /H ₄ compared to H ₁ and H ₃ .) (pK _i 6.3–7.6) [516, 517, 1188, 1189, 1389, 2226]
Selective antagonists	clemastine (pK _i 10.3) [71], desloratadine (pK _i 9) [1156], triprolidine (pK _i 8.5–9) [188, 1352], azelastine (pK _i 8.9) [1606], astemizole (pK _i 8.5) [1547]	tiotidine (pK _i 7.5) [149] – Rat, ranitidine (pK _i 7.1) [1152], cimetidine (pK _i 6.8) [274]	pitolisant (pK _i 8.1–8.6) [1528, 2254], A331440 (pK _i 8.5) [723], conessine (pK _i 8.3) [1528], MK-0249 (pK _i 8.2) [1528], ciproxifan (pK _i 6.7–7.3) [368, 516, 517, 1170, 1528, 2139]	ZPL-3893787 (pK _i 8.3) [1528], INCB-38579 (pK _i 8.3) [1528], JNJ 7777120 (pK _i 7.8–8.3) [1173, 1839, 1959], JNJ-39758979 (pK _i 7.9) [1528, 1727]
Labelled ligands	[³ H]pyrilamine (Antagonist, Inverse agonist) (pK _d 8.4–9.1) [422, 1352, 1746, 1766], [¹¹ C]doxepin (Antagonist) (pK _d 9) [869], [¹¹ C]pyrilamine (Antagonist, Inverse agonist)	[¹²⁵ I]iodoaminopotentidine (Antagonist) (pK _d 8.7) [1082] – Rat, [³ H]tiotidine (Antagonist) (pK _d 7.7–8.7) [1363]	[¹²³ I]iodopoxyfan (Antagonist) (pK _d 10.2) [1170], [¹²⁵ I]iodophenpropit (Antagonist) (pK _d 9.2) [891] – Rat, [³ H](R)-α-methylhistamine (Agonist) [1188], Nc-[³ H]α-methylhistamine (Agonist) [317] – Mouse	[³ H]JNJ 7777120 (Antagonist) (pK _d 8.4) [1959]

Comments: histaprodifen and methylhistaprodifen are reduced efficacy agonists. The H₄ receptor appears to exhibit broadly similar pharmacology to the H₃ receptor for imidazole-containing ligands, although (*R*)- α -methylhistamine and *N*- α -methylhistamine are less potent, while clobenpropit acts as a reduced efficacy agonist at the H₄ receptor and an antagonist at the H₃ receptor [1188, 1419, 1455, 1489, 2226]. Moreover, 4-methylhistamine is identified as a high affinity, full agonist for the human H₄ receptor [1173]. [³H]histamine has been used to label the H₄ receptor in heterologous expression systems.

Hydroxycarboxylic acid receptors

G protein-coupled receptors → Hydroxycarboxylic acid receptors

Overview: The hydroxycarboxylic acid family of receptors endogenous hydroxy carboxylic acids 3-hydroxy butyric acid and L-lactic acid, as well as the lipid lowering agents nicotinic acid (niacin), acipimox and acifran [1842, 1989, 2125]. These receptors were provisionally described as nicotinic acid receptors, although nicotinic acid shows submicromolar potency at HCA₂ receptors only and is unlikely to be the natural ligand [1989, 2125].

Nomenclature	HCA ₁ receptor	HCA ₂ receptor	HCA ₃ receptor
HGNC, UniProt	HGAR1, Q9BXC0	HGAR2, Q8TDS4	HGAR3, P49019
Potency order of endogenous ligands	–	β -D-hydroxybutyric acid > butyric acid	–
Endogenous agonists	L-lactic acid [16, 266, 1190, 1854] 3,5-dihydroxybenzoic acid [1187]	β -D-hydroxybutyric acid [1912], butyric acid SCH 900271 [1522], GSK256073 [1861]	3-hydroxyoctanoic acid [15]
Agonists	–	MK 6892 [1788], MK 1903 [166], nicotinic acid [1842, 1989, 2125], acipimox [1842, 2125], monomethylfumurate [1933]	compound 60 [1820], IBC 293 [1769]
Selective agonists	–	[³ H]nicotinic acid (Agonist) [1842, 1989, 2125]	–
Labelled ligands	–		–

Comments: Further closely-related GPCRs include the 5-oxoelicosanoid receptor (*OXER1*, *Q8TDS5*) and *GPR31* (*O00270*). Lactate activates HCA₁ on adipocytes in an autocrine manner. It inhibits lipolysis and thereby promotes anabolic effects. HCA₂ and HCA₃ regulate adipocyte lipolysis and immune functions under conditions of increased FFA formation through lipolysis (e.g., during fasting). HCA₂ agonists acting mainly through the receptor on immune cells exert antiatherogenic and anti-inflammatory effects. HCA₂ is also a receptor for butyrate and mediates some of the beneficial effects of short-chain fatty acids produced by gut microbiota.

Kisspeptin receptor

G protein-coupled receptors → Kisspeptin receptor

Overview: The kisspeptin receptor (**nomenclature as agreed by the NC-IUPHAR Subcommittee on the kisspeptin receptor [10041]**), like neuropeptide FF (NPFF), prolactin-releasing peptide (PrP) and QRFP receptors (provisional nomenclature) responds to endogenous peptides with an arginine-phenylalanine-amide (Rfamide) motif. Kisspeptin-54 (*KISS1*, *Q15726*) (KP54, originally named metastatin), kisspeptin-13 (*KISS1*, *Q15726*) (KP13) and kisspeptin-10 (*KISS1*) (KP10) are biologically-active peptides cleaved from the *KISS1* (*Q15726*) gene product. Kisspeptins have roles in, for example, cancer metastasis, fertility/puberty regulation and glucose homeostasis.

Nomenclature	kisspeptin receptor
HGNC, UniProt	<i>KISS1R</i> , <i>Q969F8</i>
Endogenous agonists	kisspeptin-10 (<i>KISS1</i>) [1041, 1501], kisspeptin-54 (<i>KISS1</i> , <i>Q15726</i>) [1041, 1501], kisspeptin-14 (<i>KISS1</i> , <i>Q15726</i>) [1041], kisspeptin-13 (<i>KISS1</i> , <i>Q15726</i>) [1041]
Selective agonists	4-fluorobenzoyl-FGLRW-NH2 [1973], [dY] ¹ KP-10 [401] – Mouse
Selective antagonists	peptide 234 [1674]
Labelled ligands	[125I]Tyr ⁴⁵ -kisspeptin-15 (Agonist) [1501], [125I]kisspeptin-13 (human) (Agonist) [1314], [125I]kisspeptin-10 (human) (Agonist) [1041], [125I]kisspeptin-14 (human) (Agonist) [1314]

Leukotriene receptors

G protein-coupled receptors → Leukotriene receptors

Overview: The leukotriene receptors (**nomenclature as agreed by the NC-IUPHAR subcommittee on Leukotriene Receptors** [257, 258]) are activated by the endogenous ligands leukotrienes (LT), synthesized from lipoxygenase metabolism of arachidonic acid. The human BLT₁ receptor is the high affinity LT_{B4} receptor whereas the BLT₂ receptor in addition to being a low-affinity LT_{B4} receptor also binds several other lipoxygenase-products, such as 12S-HETE, 12S-HETE, 15S-HETE, and the thromboxane synthase product 12-hydroxyheptadecatrienoic acid. The BLT receptors mediate chemotaxis and immunomodulation in several leukocyte populations and are in addition expressed on non-myeloid cells, such as vascular smooth muscle and endothelial cells. In addition to BLT receptors, LT_{B4} has been reported to bind to the peroxisome proliferator activated receptor (PPAR) α [1178] and the vanilloid TRPV1 ligand-gated nonselective cation channel [1307]. The receptors for the cysteinyl-leukotrienes (*i.e.* LTC₄, LTD₄ and LTE₄) are termed CysLT₁ and CysLT₂ and exhibit distinct expression patterns in human tissues, mediating for example smooth muscle cell contraction, regulation of vascular permeability, and leukocyte activation. There is also evidence in the literature for additional CysLT receptor subtypes, derived from functional *in vitro* studies, radioligand binding and in mice lacking both CysLT₁ and CysLT₂ receptors [258]. Cysteinyl-leukotrienes have also been suggested to signal through the P2Y₁₂ receptor [570, 1473, 1534], GPR17 [359] and GPR99 [943].

Nomenclature	BLT ₁ receptor	BLT ₂ receptor	CysLT ₁ receptor	CysLT ₂ receptor
HGNC, UniProt	LTB4R, Q15722	LTBR2, Q9NPC1	CYSLTR1, Q9Y271	CYSLTR2, Q9NS75
Potency order of endogenous ligands	LTB ₄ > 20-hydroxy-LTB ₄ > 12R-HETE [2185]	12-hydroxyheptadecatrienoic acid > LTB ₄ > 12S-HETE = 12S-HPETE > 15S-HETE > 12R-HETE > 20-hydroxy-LTB ₄ [1510, 2185]	LTD ₄ > LTC ₄ > LTE ₄ [1222, 1716]	LTC ₄ > LTD ₄ > LTE ₄ [767, 1477, 1920]
Endogenous agonists	–	12S-HETE (Partial agonist) [2185]	–	–
Antagonists	–	–	ICI198615 (pK _i 9.7) [591] – Guinea pig zafirlukast (pK ₅₀ 8.6–8.7) [1222, 1716], SR2640 (pK _i 8.7), montelukast (pK ₅₀ 8.3–8.6) [1222, 1716], sulukast (pK _i 8.3), pobukast (pK ₅₀ 7.5) [1716]	BAVu9773 (pA ₂ 6.8–7.7) [1988] – Rat BayCysLT ₂ (pK ₅₀ 6.6–7.3) [1456]
Selective antagonists	–	LY255283 (pK ₅₀ 6–7.1) [780, 2185]	–	–
Labelled ligands	[³ H]LTB ₄ (Agonist) [2184], [³ H]CGS23131 (Antagonist) (pK _d 7.9) [877]	[³ H]LTB ₄ (pK _d 7.6–9.7)	[³ H]LTD ₄ (Agonist), [³ H]ICI198615 (Antagonist) (pK _d 10.6) [1682]	[³ H]LTD ₄ (Agonist) [767]

Nomenclature	OXE receptor	FP/R2/ALX
HGNC, UniProt	OXER1, Q8TDS5	FP/R2, P25090
Potency order of endogenous ligands	5-oxo-ETE, 5-oxo-C20:3, 5-oxo-ODE > 5-oxo-15-HETE > 5S-HPETE > 5S-HETE [823, 920, 1538]	LXA ₄ = aspirin triggered lipoxin A ₄ = ATL _{a2} = resolvin D1 > LTG ₄ = LTD ₄ >> 15-deoxy-LXA ₄ >> [Met-Leu-Phe [365, 544, 546, 684, 1919]
Endogenous agonists	5-oxo-ETE [672, 1483, 1538, 1597, 1752]	LXA ₄ [1052], resolvin D1 [1052], aspirin-triggered resolvin D1 [1051], aspirin triggered lipoxin A ₄
Selective agonists	–	ATL _{a2} [697]
Endogenous antagonists	5-oxo-12-HETE (pIC ₅₀ 6.3) [1596]	–
Selective antagonists	–	WRW _{WWWW} (pIC ₅₀ 6.6) [83], t-Boc-FLELF (pIC ₅₀ 4.3–6) [574, 1867, 2061]
Labelled ligands	[³ H]5-oxo-ETE (Agonist) [1483]	[³ H]LXA ₄ (Agonist) [544, 545]

Comments: The FPR2/ALX receptor (**nomenclature as agreed by the NC-IUPHAR subcommittee on Leukotriene and Lipoxin Receptors [258]**) is activated by the endogenous lipid-derived, anti-inflammatory ligands lipoxin A₄ (LXA₄) and 15-epi-LXA₄ (**aspirin triggered lipoxin A₄**, ATL). The FPR2/ALX receptor also interacts with endogenous peptide and protein ligands, such as MHC binding peptide [330] as well as **annexin 1 (ANXA1, P04083)** (ANXA1) and its N-terminal peptides [379, 1560]. In addition, a soluble hydrolytic product of protease action on the urokinase-type plasminogen activator receptor has been reported to activate the FPR2/ALX receptor [1646]. Furthermore, FPR2/ALX has been suggested to act as a receptor mediating the proinflammatory actions of the acute-phase reactant, serum amyloid A [1840, 1883]. The agonist activity of the lipid mediators described has been questioned [732, 1585], which may derive from batch-to-batch differences, partial agonism or biased agonism. Recent results from Cooray *et al.* (2013) [379] have addressed this issue and the role of homodimers and heterodimers in intracellular signalling. A receptor selective for LXB₄ has been suggested from functional studies [58, 1232, 1670]. Note that the data for FPR2/ALX are also reproduced on the **Formylpeptide receptor** pages.

Oxoicosanoid receptors (OXE, **nomenclature agreed by the NC-IUPHAR subcommittee on Oxoicosanoid Receptors [219]**) are activated by endogenous chemotactic eicosanoid ligands oxidised at the C-5 position, with 5-oxo-ETE the most potent agonist identified for this receptor. Initial characterization of the heterologously expressed OXE receptor suggested that polyunsaturated fatty acids, such as **docosahexaenoic acid** and **EPA**, acted as receptor antagonists [823].

Lysophospholipid (LPA) receptors

G protein-coupled receptors → Lysophospholipid (LPA) receptors

Overview: Lysophosphatidic acid (LPA) receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Lysophospholipid Receptors [414, 983]**) are activated by the endogenous phospholipid metabolite *LPA*. The first receptor, *LPA₁*, was identified as *ventricular zone gene-1 (vzg-1)*, leading to deorphanisation of members of the endothelial differentiation gene (*edg*) family as other LPA receptors along with sphingosine 1-phosphate (S1P) receptors. Additional LPA receptor GPCRs were later identified. Gene names have been codified as *LPA₁*, etc. to reflect the receptor function of proteins. The crystal structure of *LPA₁* was recently solved and demonstrates extracellular LPA access to the binding pocket, consistent with proposed delivery *via* autotaxin. These studies have also implicated cross-talk with endocannabinoids *via* phosphorylated intermediates that can also activate these receptors. The identified receptors can account for most, although not all, LPA-induced phenomena in the literature, indicating that a majority of LPA-dependent phenomena are receptor-mediated. Radioligand binding has been conducted in heterologous expression systems using [³H]*LPA* (e.g. [586]). In native systems, analysis of binding data is complicated by metabolism and high levels of nonspecific binding, and therefore the relationship between recombinant and endogenously expressed receptors is unclear. Targeted deletion of LPA receptors has clarified signalling pathways and identified physiological and pathophysiological roles. Independent validation by multiple groups has been reported in the peer-reviewed literature for all six LPA receptors described in the tables, including further validation using a distinct read-out *via* a novel TGF- α "shedding" assay [864]. *LPA* has also been described as an agonist for the transient receptor potential (Trp) ion channel TRPV1 [1461] and TRPA1 [1012]. In addition, orphan GPCRs (GSD24 [547] and GPR87 [1488]) are proposed as LPA receptors. LPA was originally proposed to be a ligand for GPCR35, but recent data shows that in fact it is a receptor for *CXCL17 (CXCL17, Q6UXB2)* [1266]. Further, the nuclear hormone receptor PPAR γ [1309, 1812], has been reported as an LPA receptor. All of these proposed entities require confirmation and are not currently recognized as *bona fide* LPA receptors.

Nomenclature	LPA ₁ receptor	LPA ₂ receptor	LPA ₃ receptor	LPA ₄ receptor	LPA ₅ receptor	LPA ₆ receptor
HGNC, UniProt	<i>LPA₁</i> , Q92633	<i>LPA₂</i> , Q9HBW0	<i>LPA₃</i> , Q9UBY5	<i>LPA₄</i> , Q99677	<i>LPA₅</i> , Q9H1C0	<i>LPA₆</i> , P43657
Selective agonists	–	dodecylphosphate [2038], decyl dihydrogen phosphate [2038], GRI977143 [1007]	OMPT [744]	–	–	–
Sub/family-selective antagonists	KI16425 (p <i>K</i> ₅₀ 6.6–6.9) [1499] – Mouse, VPC12249 (p <i>K</i> _i 5.2–6.9) [769] – Mouse, VPC32179 [763]	–	KI16425 (p <i>K</i> _i 6.4) [1499], VPC12249 (p <i>K</i> _i 6.4) [769], VPC32179 [763]	–	–	–
Selective antagonists	BMS-986020 (p <i>K</i> ₅₀ 8.9), AM966 (p <i>K</i> ₅₀ 6.7–7.8) [1905], ONO-7300243 (p <i>K</i> ₅₀ 6.8) [1940], AM095 (p <i>K</i> ₅₀ 6–6.1) [1905]	–	diocetanol/glycerol pyrophosphate (p <i>K</i> _i 5.5–7) [548, 1499]	–	TCLPAs (p <i>K</i> ₅₀ 6.1) [1047]	–

Comments: KI16425 [1499], VPC12249 [769] and VPC32179 [763] have dual antagonist activity at *LPA₁* and *LPA₃* receptors. There is growing evidence for *in vivo* efficacy of these chemical antagonists in several disorders, including fetal hydrocephalus [2197], fetal hypoxia [1495], lung fibrosis [1495], systemic sclerosis [1495] and atherosclerosis progression [1053]. Virtual screening experiments have shown H2L5186303 to be a potent antagonist of *LPA₂* [536]. Dodecylphosphate is also an antagonist at *LPA₃* receptors [2038].

Lysophospholipid (S1P) receptors

G protein-coupled receptors → Lysophospholipid (S1P) receptors

Overview: Sphingosine 1-phosphate (S1P) receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Lysophospholipid receptors [983]**) are activated by the endogenous lipid **sphingosine 1-phosphate (S1P)** and with lower apparent affinity, **sphingosylphosphorylcholine (SPC)**. Originally cloned as orphan members of the endothelial differentiation gene (*edg*) family, deorphanisation as lysophospholipid receptors for S1P was based on sequence homology to LPA receptors. Current gene names have been codified as S1P₁R, etc. to reflect the receptor function of these proteins. Most cellular phenomena ascribed to S1P can be explained by receptor-mediated mechanisms; S1P has also been described to act at intracellular sites [1915], and awaits precise definition. Previously-proposed SPC (or lysophosphosphatidylcholine) receptors- G2A, TDA68, OGR1 and GPR4- continue to lack confirmation of these roles [414]. The relationship between recombinant and endogenously expressed receptors is unclear. Radioligand binding has been conducted in heterologous expression systems using [³²P]S1P (*e.g* [1505]). In native systems, analysis of binding data is complicated by metabolism and high levels of nonspecific binding. Targeted deletion of several S1P receptors and key enzymes involved in S1P biosynthesis or degradation has clarified signalling pathways and physiological roles. A crystal structure of an S1P₁-t4 fusion protein has been described [733].

The S1P receptor modulator, **fingolimod** (FTY720, Gilenya), has received world-wide approval as the first oral therapy for relapsing forms of multiple sclerosis. This drug has a novel mechanism of action involving modulation of S1P receptors in both the immune and nervous systems [340, 369, 687], although the precise nature of its interaction requires clarification.

Nomenclature	S1P ₁ receptor	S1P ₂ receptor	S1P ₃ receptor	S1P ₄ receptor	S1P ₅ receptor
HCNC, UniProt	<i>S1PR1</i> , P21453	<i>S1PR2</i> , O95136	<i>S1PR3</i> , Q99500	<i>S1PR4</i> , O95977	<i>S1PR5</i> , Q9H228

(continued)				
Nomenclature	S1P ₁ receptor	S1P ₂ receptor	S1P ₃ receptor	S1P ₄ receptor
Selective antagonists	NIBR-0213 (pIC ₅₀ 8.6) [1615], W146 (pK _i 7.1) [1714]	JTE-013 (pIC ₅₀ 7.8) [1515]	–	–

Comments: The FDA-approved immunomodulator fingolimod (FTY720) can be phosphorylated *in vivo* [31] to generate a relatively potent agonist with activity at S1P₁, S1P₃, S1P₄ and S1P₅ receptors [220, 1259]. The physiological consequences of FTY720-phosphate administration, as well as those of other S1P₁ agonists, may involve functional antagonism *via* ubiquitination and subsequent degradation of S1P₁ [1514].

Melanin-concentrating hormone receptors

G protein-coupled receptors → Melanin-concentrating hormone receptors

Overview: Melanin-concentrating hormone (MCH) receptors (**provisional nomenclature as recommended by NC-IUPHAR [557]**) are activated by an endogenous nonadecameric cyclic peptide identical in humans and rats (DHDMLRCMLGRYRPCWQV) generated from a precursor (*PMCH*, P20382), which also produces *neuropeptide EI* (*PMCH*, P20382) and *neuropeptide GE* (*PMCH*, P20382).

		MCH ₁ receptor	MCH ₂ receptor
Nomenclature		<i>MCH₁ receptor</i>	<i>MCH₂ receptor</i>
HGNC, UniProt		<i>MCHR1</i> , Q99705	<i>MCHR2</i> , Q969V1
Selective antagonists		GW803430 (pIC ₅₀ 9.3) [781], SNAP-7941 (pA ₂ 9.2) [190], T-226296 (pIC ₅₀ 8.3) [1926], ATC0175 (pIC ₅₀ 7.9–8.1) [297]	–
Labelled ligands		[¹²⁵ I]JS36057 (Antagonist) (pK _d 9.2–9.5) [69], [¹²⁵ I][Phe ¹³ , Tyr ¹⁹]MCH (Agonist) [249], [³ H]MCH (human, mouse, rat) (Agonist) [249]	–

Comments: The MCH₂ receptor appears to be a non-functional pseudogene in rodents [1930].

Melanocortin receptors

G protein-coupled receptors → Melanocortin receptors

Overview: Melanocortin receptors (**provisional nomenclature as recommended by NC-IUPHAR [557]**) are activated by members of the melanocortin family (α -MSH (*POMC*, P01189), β -MSH (*POMC*, P01189) and γ -MSH (*POMC*, P01189) forms; δ form is not found in mammals) and adrenocorticotrophin (ACTH (*POMC*, P01189)). Endogenous antagonists include agouti (*ASIP*, P42127) and agouti-related protein (*AGRP*, O00253). ACTH(1–24) was approved by the US FDA as a diagnostic agent for adrenal function test. At least 2 synthetic melanocortin receptor agonists are under clinical development as of 2017.

Nomenclature	MC ₁ receptor	MC ₂ receptor	MC ₃ receptor	MC ₄ receptor	MC ₅ receptor
HGNC, UniProt	MC1R, Q01726	MC2R, Q01718	MC3R, P41968	MC4R, P32245	MC5R, P33032
Potency order of endogenous ligands	α -MSH (<i>POMC</i> , P01189) > β -MSH (<i>POMC</i> , P01189) > ACTH (<i>POMC</i> , P01189), γ -MSH (<i>POMC</i> , P01189)	ACTH (<i>POMC</i> , P01189)	γ -MSH (<i>POMC</i> , P01189), β -MSH (<i>POMC</i> , P01189) > ACTH (<i>POMC</i> , P01189), α -MSH (<i>POMC</i> , P01189)	β -MSH (<i>POMC</i> , P01189) > α -MSH (<i>POMC</i> , P01189), ACTH (<i>POMC</i> , P01189) > γ -MSH (<i>POMC</i> , P01189)	α -MSH (<i>POMC</i> , P01189) > β -MSH (<i>POMC</i> , P01189) > ACTH (<i>POMC</i> , P01189) > γ -MSH (<i>POMC</i> , P01189)
Selective agonists	–	corticotropin zinc hydroxide	[D-Trp ⁸]- γ -MSH [679]	THIQ [1760]	–
Antagonists	–	–	PG-106 (pIC ₅₀ 6.7) [680]	–	–
Selective antagonists	–	–	–	MBP10 (pIC ₅₀ 10) [123], HS014 (pK _i 8.5) [1738]	–
Labelled ligands	[¹²⁵ I]NDP-MSH (Agonist) [1037]	[¹²⁵ I]ACTH-(1–24) (Agonist)	[¹²⁵ I]NDP-MSH (Agonist) [1037], [¹²⁵ I]SHU9119 (Antagonist) [1457]	[¹²⁵ I]SHU9119 (Antagonist) (pK _d 9.2) [1457], [¹²⁵ I]NDP-MSH (Agonist) [1037, 1736]	[¹²⁵ I]NDP-MSH (Agonist) [1037]

Comments: Polymorphisms of the MC₁ receptor have been linked to variations in skin pigmentation. Defects of the MC₂ receptor underlie familial glucocorticoid deficiency. Polymorphisms of the MC₄ receptor have been linked to obesity [296, 531].

Melatonin receptors

G protein-coupled receptors → Melatonin receptors

Overview: Melatonin receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Melatonin Receptors [474]**) are activated by the endogenous ligands **melatonin** and clinically used drugs like **ramelteon** and **agomelatine**.

Nomenclature	MT ₁ receptor	MT ₂ receptor
HCNC, UnIProt	MTNR1A, P48039	MTNR1B, P49286
Endogenous agonists	melatonin [70, 473, 475]	melatonin [70, 473, 475]
Agonists	ramelteon [954], agomelatine [70, 136]	agomelatine [70, 136], ramelteon [954, 1636] UCM1014 [1855], Ilk7 [332, 1888], 5-methoxy-luzindole (Partial agonist) [475]
Selective agonists	–	4P-PDOT (pK _i 8.8–9.4) [70, 475, 476], K185 (pK _i 9.3) [532, 1888], DH97 (pK _i 8) [1939]
Selective antagonists	–	[¹²⁵ I]SD6 (Agonist) [1138], 2-[²⁵ I]melatonin (Agonist) [70, 475], [¹²⁵ I]DIV880 (Agonist, Partial agonist) [1138], [³ H]melatonin (Agonist) [235]
Labelled ligands	[¹²⁵ I]SD6 (Agonist) [1138], 2-[²⁵ I]melatonin (Agonist) [70, 475], [³ H]melatonin (Agonist) [235]	

Comments: **melatonin**, **2-iodo-melatonin**, **agomelatine**, **GR 196429**, **LY 156735** and **ramelteon** [954] are nonselective agonists for MT₁ and MT₂ receptors. (-)-AMMTC displays an ~400-fold greater agonist potency than (+)-AMMTC at rat MT₁ receptors (see **AMMTC** for structure) [1966]. **Luzindole** is an MT₁/MT₂ non-selective competitive melatonin receptor antagonist with about 15–25 fold selectivity for the MT₂ receptor [476]. MT₁/MT₂ heterodimers present different pharmacological profiles from MT₁ and MT₂ receptors [75].

The MT₃ binding site of hamster brain and peripheral tissues such as kidney and testis, also termed the ML₂ receptor, binds selectively **2-iodo-[¹²⁵I]SMCA-NAT** [1356]. Pharmacological investigations of MT₃ binding sites have primarily been conducted in hamster tissues. At this site, The endogenous ligand **N-acetylserotonin** [495, 1215, 1356, 1588] and **SMCA-NAT** [1588] appear to function as agonists, while **prazosin** [1215] functions as an antagonist. The MT₃ binding site of hamster kidney was also identified as the hamster homologue of human quinone reduc-

tase 2 (NQO2, P16083 [1474, 1475]). The MT₃ binding site activated by **SMCA-NAT** in eye ciliary body is positively coupled to adenylyl cyclase and regulates chloride secretion [842]. *Xenopus* melanophores and chick brain express a distinct receptor (x420, P49219; c346, P49288, initially termed Mel_{1C}) coupled to the G_{i/o} family of G proteins, for which GPR50 has recently been suggested to be a mammalian counterpart [479] although **melatonin** does not bind to GPR50 receptors. Several variants of the **MTNR1B** gene have been associated with increased type 2 diabetes risk.

Metabotropic glutamate receptors

G protein-coupled receptors → Metabotropic glutamate receptors

Overview: Metabotropic glutamate (mGlu) receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Metabotropic Glutamate Receptors [1743]**) are a family of G-protein coupled receptors activated by the neurotransmitter glutamate. The mGlu family is composed of eight members (named mGlu1 to mGlu8) which are divided in three groups based on similarities of agonist pharmacology, primary sequence and G protein coupling to effector: Group-I (mGlu1 and mGlu5), Group-II (mGlu2 and mGlu3) and Group-III (mGlu4, mGlu6, mGlu7 and mGlu8) (see Further reading).

Structurally, mGlu are composed of three juxtaposed domains: a core G-protein-activating seven-transmembrane domain (TM), common to all GPCRs, is linked via a rigid cysteine-rich domain (CRD) to the Venus Flytrap domain (VFTD), a large bi-lobed extracellular domain where glutamate binds. The structures of the VFTD of mGlu1, mGlu2, mGlu3, mGlu5 and mGlu7 have been

solved [1075, 1364, 1408, 1984]. The structure of the 7 transmembrane (TM) domains of both mGlu1 and mGlu5 have been solved, and confirm a general helical organization similar to that of other GPCRs, although the helices appear more compacted [465, 2136]. mGlu form constitutive dimers crosslinked by a disulfide bridge. Although mGlu receptors have been thought to only form homodimers, recent studies revealed the possible formation of heterodimers between either group-I receptors, or within and between group-II and -III receptors [468]. Although well characterized in transfected cells, co-localization and specific pharmacological properties also suggest the existence of such heterodimers in the brain [2183].

The endogenous ligands of mGlu are **L-glutamic acid**, **L-serine-O-phosphate**, **N-acetylaspartylglutamate (NAAG)** and **L-cysteine sulphonic acid**. Group-I mGlu receptors may be activated by 3,5-DHPG and (**S**)-3HPG [204] and antagonized by

(**S**)-hexylhomobotenic acid [1235]. Group-II mGlu receptors may be activated by LY389795 [1365], LY379268 [1365], eglumegad [1744, 2138], DCG-IV and (2*R*,3*R*)-ADPC [1745], and antagonised by eGlu [890] and LY307452 [518, 2096]. Group-III mGlu receptors may be activated by L-AP4 and (*R*,*S*)-4-PPG [610]. An example of an antagonist selective for mGlu receptors is LY341495, which blocks mGlu2 and mGlu3 at low nanomolar concentrations, mGlu4 at high nanomolar concentrations, and mGlu4, mGlu5, and mGlu7 in the micromolar range [1001]. In addition to orthosteric ligands that directly interact with the glutamate recognition site, allosteric modulators that bind within the TM domain have been described. Negative allosteric modulators are listed separately. The positive allosteric modulators most often act as 'potentiators' of an orthosteric agonist response, without significantly activating the receptor in the absence of agonist.

Agonists	–	LSP4-2022 [666], L-serine-O-phosphate [2138], L-AP4 [2138]		(S)-3,4-DCPC [1952], L-AP4 [1254]
Selective agonists	1-benzyl-APDC [1987] – Rat, homo-AMPA [244]	–		–
Antagonists	MAD4 (pIC ₅₀ 3.5) [1575] – Rat, THPG [1956]	–		MPPC (pIC ₅₀ 4.3) [2138]
Allosteric modulators	–	MMPIP (Negative) (pIC ₅₀ 6.1–7.6) [1467, 1900] – Rat, ADX71743 (Negative) (pIC ₅₀ 7.2) [938], AMN082 (Positive) (pEC ₅₀ 6.5–6.8) [1349], XAP044 (Negative) (pIC ₅₀ 5.6) [618]		–

Comments: The activity of **NAAG** as an agonist at mGlu₃ receptors was questioned on the basis of contamination with glutamate [341, 576], but this has been refuted [1430].

Radioligand binding using a variety of radioligands has been conducted on recombinant receptors (for example, [³H]R214127 [1103] and [³H]YM298198 [1025] at mGlu₁ receptors and [³H]M-MEP [609] and [³H]methoxymethyl-MTEP [48] at mGlu₃ receptors. Although a number of radioligands have been used to examine binding in native tissues, correlation with individual subtypes is limited. Many pharmacological agents have not been fully tested across all known subtypes of mGlu receptors. Po-

tential differences linked to the species (e.g. human versus rat or mouse) of the receptors and the receptor splice variants are generally not known. The influence of receptor expression level on pharmacology and selectivity has not been controlled for in most studies, particularly those involving functional assays of receptor coupling.

(S)-(+)-CBPG is an antagonist at mGlu₁, but is an agonist (albeit of reduced efficacy) at mGlu₃ receptors. DCG-IV also exhibits agonist activity at NMDA glutamate receptors [2007], and is an antagonist at all Group-III mGlu₃s with an IC₅₀ of 30 μM. A potential novel metabotropic glutamate receptor coupled to phosphoinositide turnover has been observed in rat brain; it is ac-

tivated by 4-methylhomobotenic acid (ineffective as an agonist at recombinant Group I metabotropic glutamate receptors), but is resistant to LY341495 [356]. There are also reports of a distinct metabotropic glutamate receptor coupled to phospholipase D in rat brain, which does not readily fit into the current classification [1013, 1549]

A related class C receptor composed of two distinct subunits, T1R1 + T1R3 is also activated by glutamate and is responsible for umami taste detection.

All selective antagonists at metabotropic glutamate receptors are competitive.

Motilin receptor

G protein-coupled receptors → Motilin receptor

Overview: Motilin receptors (**provisional nomenclature**) are activated by **motilin (MLN, P12872)**, a 22 amino-acid peptide derived from a precursor (**MLN, P12872**), which may also generate a **motilin-associated peptide (MLN, P12872)**. These receptors promote gastrointestinal motility and are suggested to be responsible for the gastrointestinal prokinetic effects of certain macrolide antibiotics (often called motilides; e.g. erythromycin), although for many of these molecules the evidence is sparse.

Nomenclature	motilin receptor
HCNC, UniProt	MLNR, O43193
Endogenous agonists	motilin (MLN, P12872) [386, 1286, 1287, 1288]
Agonists	alendincin [1947], erythromycin-A [533, 1947], azithromycin [225]
Selective agonists	camicalin [105, 1712], mitemincin [1023, 1918] – Rabbit
Selective antagonists	MA-2029 (pA ₂ 9.2) [1884], GM-109 (pIC ₅₀ 8) [736] – Rabbit
Labelled ligands	[125]motilin (human) (Agonist) [533]

Comments: In terms of structure, the motilin receptor has closest homology with the ghrelin receptor. Thus, the human motilin receptor shares 52% overall amino acid identity with the ghrelin receptor and 86% in the transmembrane regions [759, 1918, 1947]. However, differences between the N-terminus regions of these receptors means that their cognate peptide ligands do not readily activate each other [408, 1712]. In laboratory rodents, the gene encoding the motilin precursor appears to be absent, while the receptor appears to be a pseudogene [759, 1710]. Functions of motilin (MLN, P12872) are not usually detected in rodents, al-

though brain and other responses to motilin and the macroide **alendicinal** have been reported and the mechanism of these actions is obscure [1311, 1462]. Notably, in some non-laboratory rodents (e.g., the North American kangaroo rat (*Dipodomys*) and mouse (*Microdipodops*) a functional form of motilin may exist but the motilin receptor is non-functional [1159]. Marked differences in ligand affinities for the motilin receptor in dogs and humans may be explained by significant differences in receptor structure [1711]. Note that for the complex macroide structures, selectivity of action has often not been rigorously examined and other ac-

tions are possible (e.g., P2X inhibition by erythromycin, [2216]). Small molecule motilin receptor agonists are now described [1159, 1712, 2100]. The motilin receptor does not appear to have constitutive activity [812]. Although not proven, the existence of biased agonism at the receptor has been suggested [1288, 1348, 1709]. A truncated 5-transmembrane structure has been identified but this is without activity when transfected into a host cell [533]. Receptor dimerisation has not been reported.

Neuromedin U receptors

G protein-coupled receptors → Neuromedin U receptors

Overview: Neuromedin U receptors (**provisional nomenclature as recommended by NC-IUPHAR [557]**) are activated by the endogenous 25 amino acid peptide neuromedin U (neuromedin U-25 (NMU, P48645), NmU-25), a peptide originally isolated from pig spinal cord [1344]. In humans, NmU-25 appears to be the sole product of a precursor gene (NMU, P48645) showing a broad tissue distribution, but which is expressed at highest lev-

els in the upper gastrointestinal tract, CNS, bone marrow and fetal liver. Much shorter versions of NmU are found in some species, but not in human, and are derived at least in some instances from the proteolytic cleavage of the longer NmU. Despite species differences in NmU structure, the C-terminal region (particularly the C-terminal pentapeptide) is highly conserved and contains biological activity. Neuromedin S (neuromedin S-33 (NMS, Q5H8A3))

has also been identified as an endogenous agonist [1378]. NMS-33 is, as its name suggests, a 33 amino-acid product of a precursor protein derived from a single gene and contains an amidated C-terminal heptapeptide identical to NmU. NMS-33 appears to activate NMU receptors with equivalent potency to NmU-25.

Nomenclature	NMU1 receptor	NMU2 receptor
HGNC, UniProt	NMUR1, Q9HB89	NMUR2, Q9GZQ4
Antagonists	-	R-PSOP (pK _B 7) [1193]

Comments: NMU1 and NMU2 couple predominantly to G_{q/11} although there is evidence of good coupling to G_{i/o} [218, 825, 833]. NMU1 and NMU2 can be labelled with [¹²⁵I]-NmU and [¹²⁵I]-NMS (of various species, e.g., [1319]), BODIPY® TMR-NMU or Cy3B-NMU-8 [218]. A range of radiolabelled (¹²⁵I), fluorescently labelled (e.g., Cy3, Cy5, rhodamine and FAM) and biotin labelled versions of neuromedin U-25 (NMU, P48645) and neuromedin S-33 (NMS, Q5H8A3) are now commercially available.

Neuropeptide FF/neuropeptide Af receptors

G protein-coupled receptors → Neuropeptide FF/neuropeptide Af receptors

Overview: The Neuropeptide FF receptor family contains **O15130** and Rfamid related peptides (RFRP; precursor gene symbol NPVF, Q9HCQ7). NPFF1 is broadly distributed in the central nervous system with the highest levels found in the limbic system and the hypothalamus. NPFF2 is present in high density in the superficial layers of the mammalian spinal cord where it is involved in nociception and modulation of opioid functions.

Nomenclature	NPFF1 receptor	NPFF2 receptor
HGNC, UniProt	NPFFR1, Q9CZQ6	NPFFR2, Q9YSX5
Potency order of endogenous ligands	RFRP-1 (NPVF, Q9HCQ7) > RFRP-3 (NPVF, Q9HCQ7) > FMRFneuropeptide FF (NPFF, O15130) > neuropeptide Af (NPFF, O15130) > neuropeptide SF (NPFF, O15130), QRFP43 (QRFP, P83859), PrRP-31 (PRLH, P81277) [663]	neuropeptide Af (NPFF, O15130), neuropeptide FF (NPFF, O15130) > FMRF, QRFP43 (QRFP, P83859) > neuropeptide SF (NPFF, O15130) [663]
Endogenous agonists	neuropeptide FF (NPFF, O15130) [663, 664, 1359], RFRP-3 (NPVF, Q9HCQ7) [664, 665, 1359]	neuropeptide FF (NPFF, O15130) [664, 1358]
Selective agonists	–	dNPA [1681], AC263093 [1092]
Antagonists	RF9 (pK _i 7.2) [1814]	–
Selective antagonists	AC262620 (pK _i 7.7–8.1) [1092], AC262970 (pK _i 7.4–8.1) [1092]	–
Labelled ligands	[125]IY-RFRP-3 (Agonist) [664], [3H]NPVF (Agonist) [1928], [125]INPFF (Agonist) [663]	[125]IYEVF (Agonist) [1359], [3H]IYEVF (Agonist) [1928], [125]INPFF (Agonist) [663]

Comments: An orphan receptor *GP883* (Q9NYM4) shows sequence similarities with NPFF1, NPFF2, PrRP and QRFP receptors. The antagonist RF9 is selective for NPFF receptors, but does not distinguish between the NPFF1 and NPFF2 subtypes (pK_i 7.1 and 7.2, respectively, [1814]).

Neuropeptide S receptor

G protein-coupled receptors → Neuropeptide S receptor

Overview: The neuropeptide S receptor (NPS, **provisional nomenclature [557]**) responds to the 20 amino-acid peptide neuropeptide S derived from a precursor (NPS, POCOP6).

Nomenclature	NPS receptor
HGNC, UniProt	NPSR1, Q6W5P4
Endogenous agonists	neuropeptide S (NPS, POCOP6) [2159]
Selective agonists	PWT1-NPS [1692] – Mouse
Selective antagonists	NCGC 84 (pA ₂ 9) [1957], SHA 68 (pA ₂ 8.1) [1693] – Mouse, RTI-118 [2214]
Labelled ligands	[¹²⁵ I]Tyr ¹⁰ NPS (human) (Agonist) [2159]

Comments: Multiple single-nucleotide polymorphisms (SNP) played similar binding affinity but higher NPS potency (by approx. 1506, 1621). The SNP Asn¹⁰⁷Ile has also been linked to sleep and several splice variants have been identified in the human NPS 10-fold) than human NPS receptor Asn107 [1645]. Several epi-dermiological studies reported an association between Asn¹⁰⁷Ile receptor. The most interesting of these is an Asn-Ile exchange at receptor variant and susceptibility to panic disorders [458, 460, 1506, 1621]. The SNP Asn¹⁰⁷Ile has also been linked to sleep position 107 (Asn¹⁰⁷Ile). The human NPS receptor Asn¹⁰⁷Ile dis- receptor variant and susceptibility to panic disorders [458, 460, 1506, 1621]. The SNP Asn¹⁰⁷Ile has also been linked to sleep behavior [662], inflammatory bowel disease [402], schizophrenia [1145], increased impulsivity and ADHD symptoms [1083]. Interestingly, a carboxy-terminal splice variant of human NPS receptor was found to be overexpressed in asthmatic patients [1091].

Neuropeptide W/neuropeptide B receptors

G protein-coupled receptors → Neuropeptide W/neuropeptide B receptors

Overview: The neuropeptide BW receptor 1 (NPBW1, **pro-visional nomenclature** [557]) is activated by two 23-amino-acid peptides, neuropeptide W (neuropeptide W-23 (NPW, Q8N729)) and neuropeptide B (neuropeptide B-23 (NPB, Q8NG41)) [584, 1792]. C-terminally extended forms of the peptides (neuropeptide W-30 (NPW, Q8N729) and neuropeptide B-29 (NPB, Q8NG41)) also activate NPBW1 [216]. Unique to both forms of neuropeptide B is the N-terminal bromination of the first tryptophan residue, and it is from this post-translational modification that the nomenclature NPB is derived. These peptides were first identified from bovine hypothalamus and therefore are classed as neuropeptides. Endogenous variants of the peptides with-

Nomenclature	NPBW1 receptor	NPBW2 receptor
HGNC, UniProt	NPBW1, P48145	NPBW2, P48146
Potency order of endogenous ligands	neuropeptide B-29 (NPB, Q8NG41) > neuropeptide B-23 (NPB, Q8NG41) > neuropeptide W-23 (NPW, Q8N729) > neuropeptide W-30 (NPW, Q8N729) [216]	neuropeptide W-23 (NPW, Q8N729) > neuropeptide W-30 (NPW, Q8N729) > neuropeptide B-29 (NPB, Q8NG41) > neuropeptide B-23 (NPB, Q8NG41) [216]
Selective agonists	Ava3 [945], Ava5 [945]	-
Labelled ligands	[¹²⁵ I]NPW-23 (human) (Agonist) [1816]	[¹²⁵ I]NPW-23 (human) (Agonist) [1792]

Comments: Potency measurements were conducted with heterologously-expressed receptors with a range of 0.14-0.57 nM (NPBW1) and 0.98-21 nM (NPBW2). NPBW1^{-/-} mice show changes in social behavior, suggesting that the NPBW1 pathway may have an important role in the emotional responses of social interaction [1414]. For a review of the contribution of neuropeptideB/W to social dominance, see [2080]. It has been reported that neuropeptide W may have a key role in the gating of stressful stimuli when mice are exposed to novel environments [1392]. Two antagonists have been discovered and reported to have affinity for NPBW1, ML181 and ML250, the latter exhibiting improved selectivity (~ 100 fold) for NPBW1 compared to MCH1 receptors [694, 695]. Computational insights into the binding of antagonists to this receptor have also been described [1541].

Neuropeptide Y receptors

G protein-coupled receptors → Neuropeptide Y receptors

Overview: Neuropeptide Y (NPY) receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Neuropeptide Y Receptors [1330]**) are activated by the endogenous peptides **neuropeptide Y (NPY, P01303)**, **neuropeptide Y-(3-36)**, **peptide YY (PYY, P10082)**, **PYY-(3-36)** and **pancreatic polypeptide (PPY, P01298)** (PP). The receptor originally identified as the Y3 receptor has been identified as the **CXCR4** chemokine receptor (originally named LESTR, [1201]). The y6 receptor is a functional gene product in mouse, absent in rat, but contains a frameshift mutation in primates producing a truncated non-functional gene [676]. Many of the agonists exhibit differing degrees of selectivity dependent on the species examined. For example, the potency of PP is greater at the rat Y4 receptor than at the human receptor [513]. In addition, many agonists lack selectivity for individual subtypes, but can exhibit comparable potency against pairs of NPY receptor subtypes, or have not been examined for activity at all subtypes. [125]I-PYY or [125]I-NPY can be used to label Y1, Y2, Y5 and Y6 subtypes non-selectively, while [125]I[cPP(1-7), NPY(19-23), Ala31, Aib32, Gln34]hPP may be used to label Y5 receptors preferentially (note that cPP denotes chicken peptide sequence and hPP is the human sequence).

Nomenclature	Y1 receptor	Y2 receptor	Y4 receptor	Y5 receptor	Y6 receptor
HCNC, UniProt	NPY1R, P25929	NPY2R, P49146	NPY4R, P50391	NPY5R, Q15761	NPY6R, Q99463
Potency order of endogenous ligands	neuropeptide Y = peptide YY ≫ pancreatic polypeptide	peptide YY = peptide YY(3-36) = neuropeptide Y = neuropeptide Y(3-36) ≫ pancreatic polypeptide	pancreatic polypeptide ≫ neuropeptide Y = peptide YY	neuropeptide Y > peptide YY > pancreatic polypeptide	neuropeptide Y = peptide YY > pancreatic polypeptide
Endogenous agonists	neuropeptide Y (NPY, P01303), peptide YY (PYY, P10082)	PYY-(3-36) (PYY, P10082) [619, 633], neuropeptide Y (NPY, P01303), neuropeptide Y-(3-36) (NPY, P01303), peptide YY (PYY, P10082)	pancreatic polypeptide (PPY, P01298) [98, 1217, 1978, 2165]	–	–
Agonists	[Leu31,Pro34]NPY [392], [Leu31,Pro34]PYY (human), [Pro34]NPY, [Pro34]PYY (human)	–	–	–	–
Selective agonists	–	–	–	[Ala31,Aib32]NPY (pig) [264]	–
Selective antagonists	BIBO3304 (pIC50 9.5) [2110], BIBP3226 (pKi 8.1–9.3) [463, 2111]	BIBO246 (pIC50 8.5) [461], [NJ-5207787 (pIC50 6.9–7.1) [182]	–	L-152,804 (pKi 7.6) [944]	–
Selective allosteric modulators	–	–	nicosamide (Positive) [1827]	–	–
Labelled ligands	[3H]BIBP3226 (Antagonist) (pKd 8.7), [125I][Leu31,Pro34]NPY (Agonist)	[125I]PYY-(3-36) (human) (Agonist)	[125I]PP (human) (Agonist)	[125I][cPP(1-7), NPY(19-23), Ala31, Aib32, Gln34]hPP (Agonist) [481] – Rat	–

(continued)				
Nomenclature	Y ₁ receptor	Y ₂ receptor	Y ₄ receptor	Y ₅ receptor
Comments	Note that Pro ³⁴ -containing NPY and PYY can also bind Y ₄ and Y ₅ receptors, so strictly speaking are not selective, but are the 'preferred' agonists.	–	–	–

Comments: The Y₁ agonists indicated are selective relative to Y₂ receptors. [BIBP3226](#) is selective relative to Y₂, Y₄ and Y₅ receptors [\[632\]](#). [NPY-\(13-36\)](#) is Y₂ selective relative to Y₁ and Y₅ receptors. PYY-(3-36) is Y₂ selective relative to Y₁ receptors. Note that Pro³⁴-containing NPY and PYY can also bind Y₄ and Y₅, thus they are selective only relative to Y₂. The Y₆ receptor is a pseudogene in humans, but is functional in mouse, rabbit and some other mammals.

Neurotensin receptors

G protein-coupled receptors → Neurotensin receptors

Overview: Neurotensin receptors (**nomenclature as recommended by NC-IUPHAR [557]**) are activated by the endogenous tridecapeptide neurotensin (pGlu-L^{eu}-Tyr-Glu-Asn-L^{ys}-Pro-Arg-Arg-Pro-Tyr-Ile-Leu) derived from a precursor ([NTS, 30990](#)), which also generates neuromedin N, an agonist at the NTS₂ receptor. [\[³H\]neurotensin](#) (human, mouse, rat) and [\[¹²⁵I\]neurotensin](#) (human, mouse, rat) may be used to label NTS₁ and NTS₂ receptors at 0.1-0.3 and 3-5 nM concentrations respectively.

Nomenclature	NTS ₁ receptor	NTS ₂ receptor
HGNC, UniProt	NTSR1, P30989	NTSR2, O95665
Potency order of endogenous ligands	neurotensin (NTS, P30990) > neuromedin N {Mouse, Rat} [776]	neurotensin (NTS, P30990) = neuromedin N {Mouse, Rat} [1297]
Selective agonists	[MV449 [1822]] – Rat	levocabastine [1297, 1657]
Selective antagonists	meflincrant (pK_{CS0} 7.5-8.2) [699]	–
Labelled ligands	[³H]meflincrant (Antagonist) (pK _d 8.5) [1085] – Rat	–

Comments: [neurotensin](#) (*NTS*, [P30990](#)) appears to be a low-efficacy agonist at the NTS₂ receptor [[2039](#)], while the NTS₁ receptor antagonist [mecninant](#) is an agonist at NTS₂ receptors [[2039](#)]. An additional protein, provisionally termed NTS₃ (also known as NTR3, gp95 and sortilin; [ENSG00000134243](#)), has been suggested to bind lipoprotein lipase and mediate its degradation [[1460](#)]. It has been reported to interact with the NTS₁ receptor [[1273](#)] and the NTS₂ receptor [[260](#)], and has been implicated in hormone traf-

ficking and/or neurotensin uptake. A splice variant of the NTS₂ receptor bearing 5 transmembrane domains has been identified in mouse [[195](#)] and later in rat [[1561](#)].

Opioid receptors

G protein-coupled receptors → Opioid receptors

Overview: Opioid and opioid-like receptors are activated by a variety of endogenous peptides including [Met]enkephalin (*PENK*, [P01210](#)) (met), [Leu]enkephalin (*PENK*, [P01210](#)) (leu), β -endorphin (*POMC*, [P01189](#)) (β -end), α -neodymorphin (*PDYN*, [P01213](#)), dynorphin A (*PDYN*, [P01213](#)) (dynA), dynorphin B (*PDYN*, [P01213](#)) (dynB), big dynorphin (*PDYN*, [P01213](#)) (Big dyn), nociceptin/orphanin FQ (*PNOC*, [Q13519](#)) (N/OFQ); [endomorphin-1](#) and [endomorphin-2](#) are also potential endogenous peptides. The Greek letter nomenclature for the opioid receptors, μ , δ and κ , is well established, and **NC-IUPHAR** considers this nomenclature appropriate, along with the symbols spelled out (mu, delta, and kappa), and the acronyms, MOR, DOR, and KOR [[390](#), [441](#), [557](#)]. The human N/OFQ receptor, NOP, is considered 'opioid-related' rather than opioid because, while it exhibits a high degree of structural homology with the conventional opioid receptors [[1361](#)], it displays a distinct pharmacology. Currently there are numerous clinically used drugs, such as [morphine](#) and many other opioid analgesics, as well as antagonists such as [naloxone](#), however only for the μ receptor.

Nomenclature	δ receptor	κ receptor	μ receptor	NOP receptor
HGNC, UniProt	<i>OPRD1</i> , P41143	<i>OPRK1</i> , P41145	<i>OPRM1</i> , P35372	<i>OPRL1</i> , P41146
Principal endogenous agonists	β -endorphin (<i>POMC</i> , P01189), [Leu]enkephalin (<i>PENK</i> , P01210), [Met]enkephalin (<i>PENK</i> , P01210)	big dynorphin (<i>PDYN</i> , P01213), dynorphin A (<i>PDYN</i> , P01213)	β -endorphin (<i>POMC</i> , P01189), [Met]enkephalin (<i>PENK</i> , P01210), [Leu]enkephalin (<i>PENK</i> , P01210)	nociceptin/orphanin FQ (<i>PNOC</i> , Q13519) [11 , 153 , 1507]
Potential endogenous agonists	–	–	endomorphin-1, endomorphin-2, levorphanol [727], hydromorphone [2094], fentanyl [1972], buprenorphine (Partial agonist) [1972], methadone [1595], codeine [1972], tapentadol [1992], pethidine [1595]	–
Agonists	DADLE [1972], etorphine [1972], ethylketocyclazocine [1972]	–	–	–

Comments: Three naloxone-sensitive opioid receptor genes have been identified in humans, and while the μ -receptor in particular may be subject to extensive alternative splicing [1535], these putative isoforms have not been correlated with any of the subtypes of receptor proposed in years past. Opioid receptors may heterodimerize with each other or with other 7TMM receptors [926], and give rise to complexes with a unique pharmacology, however, evidence for such heterodimers in native cells is equivocal and the consequences of this heterodimerization for signalling remains

largely unknown. For μ -opioid receptors at least, dimerization does not seem to be required for signalling [1078]. A distinct met-enkephalin receptor lacking structural resemblance to the opioid receptors listed has been identified (*OGFR, 9NZT2*) and termed an opioid growth factor receptor [2198].

Endomorphin-1 and **endomorphin-2** have been identified as highly selective, putative endogenous agonists for the μ -opioid receptor. At present, however, the mechanisms for endomorphin synthesis *in vivo* have not been established, and there is no gene

identified that encodes for either. Thus, the status of these peptides as endogenous ligands remains unproven.

Two areas of increasing importance in defining opioid receptor function are the presence of functionally relevant single nucleotide polymorphisms in human μ -receptors [1490] and the identification of biased signalling by opioid receptor ligands, in particular, compounds previously characterized as antagonists [236]. Pathway bias for agonists makes general rank orders of potency and efficacy somewhat obsolete, so these do not appear in

the table. As ever, the mechanisms underlying the acute and long term regulation of opioid receptor function are the subject of intense investigation and debate. [953], whether all compounds are acting at a similar site remains to be established.

The richness of opioid receptor pharmacology has been enhanced with the recent discovery of allosteric modulators of μ and δ receptors, notably the positive allosteric modulators and silent allosteric "antagonists" outlined in [247, 248]. Negative allosteric modulation of opioid receptors has been previously suggested

Orexin receptors

G protein-coupled receptors → Orexin receptors

Overview: Orexin receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Orexin receptors [557]**) are activated by the endogenous polypeptides orexin-A (*HCRT*, O43612) and orexin-B (*HCRT*, O43612) (also known as hypocretin-1 and -2; 33 and 28 aa) derived from a common precursor, preproorexin or orexin precursor, by proteolytic cleavage [1703].

Nomenclature	OX ₁ receptor	OX ₂ receptor
HCNC, UniProt	<i>HCRT1</i> , O43613	<i>HCRT2</i> , O43614
Potency order of endogenous ligands	orexin-A (<i>HCRT</i> , O43612) > orexin-B (<i>HCRT</i> , O43612)	orexin-A (<i>HCRT</i> , O43612) = orexin-B (<i>HCRT</i> , O43612)
Selective agonists	–	[Ala ¹¹ , D-Leu ¹⁵]orexin-B [66, 1612]
Selective antagonists	suvorexant (pK _i 9.3) [391], SB-649868 (pK _i 9.1) [442], SB-674042 (pK _i 8.7–9.1) [1098, 1253, 1255], filorexant (pK _i 8.6) [2124], almorexant (pIC ₅₀ 7.9) [221], SB-408124 (pK _i 7.2–7.6) [1098, 1253], SB-334867 (pK _i 7.4–7.5) [1253, 1591]	[Ala ¹¹ , D-Leu ¹⁵]orexin-B [66, 1612] filorexant (pK _i 9.5) [2124], suvorexant (pK _i 9.5) [391], EMPA (pK _i 9) [1252], SB-649868 (pK _i 8.9) [442], JNJ-10397049 (pK _i 8–8.6) [1300], almorexant (pIC ₅₀ 8.1) [221], TCS-OX2-29 (pK _i 7.4) [798]
Labelled ligands	–	[³ H]-almorexant (Selective Antagonist) (pK _d 8.9–9.8) [1253, 1255], [³ H]Cp-1 (Selective Antagonist) (pK _d 9.2–9.4) [1253], [³ H]EMPA (Selective Antagonist) (pK _d 8.6–9) [1252, 1255], [¹²⁵ I]-orexin-A (Agonist) [1066, 1611, 1703]

Comments: The primary coupling of orexin receptors to G_{q/11} [1629] for most cellular responses observed, the G protein pathway is rather speculative and based on the strong activation of phospholipase C, though recent studies in recombinant CHO cells also stress the importance of G_{q/11} [1065]. Coupling of both receptors to G_{12/o} and G_s has also been reported [951, 1068, 1146, (≤10-fold), or selectivity may be less than 100-fold or not unequivocally determined. [Ala¹¹, D-Leu¹⁵]orexin-B may show poor OX₂ receptor selectivity [1612]. Orexin receptors have been reported to be able to form complexes with each other and some other GPCRs as well as CRF receptors [1067, 1426], which might affect the signaling and

pharmacology. Recently a promising synthetic orexin receptor lig- the OX₂ receptor underlie canine hereditary narcolepsy [1177]. orders of wakefulness [1668], while agonists would likely be useful and (compound 26) has been reported but not thoroughly charac- Antagonists of the orexin receptors are the focus of major drug in human narcolepsy. terized [1412]. Comments: A series of 4-alkyloxyimino derivatives of uridine 5'-triphosphate which could be useful for derivatization as fluorescent P2Y_{2/4/6} receptor probes has been recently synthesized [897]. Single nucleotide polymorphisms of the P2YR₁ gene are associated with different platelet reactivity to ADP ADP [784]. Three frequent nonsynonymous P2Y₂ receptor polymorphisms have been identified, one of which was significantly more common in cystic fibrosis patients. This polymorphism is linked to increases in Ca²⁺ influx in transfected cells, and might therefore play a role in disease development [263]. Although **uridine triphosphate**

(UTP) was also shown to be a biased agonist at P2Y₁₁, this is still under debate [1388, 2104]. A group of single nucleotide polymorphisms in the P2Y₁₂ gene, forming the so called P2Y₁₂ H2 haplotype, has been associated with increased platelet responsiveness to ADP, increased risk of peripheral arterial disease and with coronary artery disease [291]. The platelet-type bleeding disorder due to P2Y₁₂ receptor defects is an autosomal recessive condition characterized by mild to moderate mucocutaneous bleeding and excessive bleeding after surgery or trauma. The defect is due to the inability of ADP to induce platelet aggregation [287]. The P2Y₁₃

receptor Met-158-Thr polymorphism, which is in linkage disequilibrium with the P2Y₁₂ locus, is not associated with acute myocardial infarction, diabetes mellitus or related risk factors [44]. The P2Y₁₄ receptor was previously considered to exclusively bind sugar nucleotides such as **UDP-glucose** and **UDP-galactose** [299]. However, more recent evidence with several cell lines has demonstrated that **uridine diphosphate** (UDP) is 5-fold more potent than **UDP-glucose** [281]. UDP was also shown to competitively antagonise the UDP-glucose response at the human recombinant P2Y₁₄

Parathyroid hormone receptors

G protein-coupled receptors → Parathyroid hormone receptors

Overview: The parathyroid hormone receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Parathyroid Hormone Receptors [606]**) are family B G protein-coupled receptors. The parathyroid hormone (PTH)/parathyroid hormone-related peptide (PTHrP) receptor (PTH1 receptor) is activated by precursor-derived peptides: PTH (PTH, P01270) (84 amino acids), and PTHrP (PTHrP, P12272) (141 amino-acids) and related peptides (PTH-(1-34), PTHrP-(1-36) (PTHrP, P12272)). The parathyroid hormone 2 receptor (PTH2 receptor) is activated by the precursor-derived peptide TIP39 (PTH2, Q96A98) (39 amino acids). [125]PTH may be used to label both PTH1 and PTH2 receptors.

Nomenclature	PTH1 receptor	PTH2 receptor
HQNC, UniProt	PTH1R, Q03431	PTH2R, P49190
Potency order of endogenous ligands	PTH (PTH, P01270) = PTHrP (PTHrP, P12272)	TIP39 (PTH2, Q96A98), PTH (PTH, P01270) ≫ PTHrP (PTHrP, P12272)
Agonists	teriparatide [604]	TIP39 (PTH2, Q96A98) [661, 804]
Selective agonists	PTHrP-(1-34) (human) [605] – Rat	–

Comments: The parathyroid hormone type 1 receptor (PTHr) is the canonical GPCR for PTH and PTHrP. It is coupled to G_s and G_q and regulates the development of bone, heart, mammary glands and other tissues in response to PTHrP, and blood concentrations of calcium and phosphate ions, as well as vitamin D, in response to PTH. Another important action of the PTH/PTHr system is to stimulate bone formation when the hormone is intermittently administered (daily injection). Although PTH (PTH, P01270) is an agonist at human PTH2 receptors, it fails to activate the rodent orthologues. TIP39 (PTH2, Q96A98) is a weak antagonist at PTH1 receptors [925].

Platelet-activating factor receptor

G protein-coupled receptors → Platelet-activating factor receptor

Overview: Platelet-activating factor (PAF, 1-O-alkyl-2-acetyl-sn-glycero-3-phosphocholine) is an ether phospholipid mediator associated with platelet coagulation, but also subserves inflammatory roles. The PAF receptor (**provisional nomenclature recommended by NC-IUPHAR [557]**) is activated by PAF and other suggested endogenous ligands are oxidized phosphatidylcholine [1265] and lysophosphatidylcholine [1492]. It may also be activated by bacterial lipopolysaccharide [1417].

Nomenclature	PAF receptor
HCNC, UniProt	<i>PTAFR</i> , P25105
Selective agonists	methylcarbamyl PAF
Selective antagonists	toropafant (p <i>K</i> _i 10.3) [774], <i>ABT-491</i> (p <i>K</i> _i 9.2) [30], <i>CV-6209</i> (p <i>K</i> _i 8.1–8.3) [652, 1416], <i>L659989</i> (p <i>K</i> _i 7.8) [851], <i>apafant</i> (p <i>K</i> _i 5.2–7.5) [1529, 1904]
Labelled ligands	[³ H]PAF (Agonist) [585, 1416]

Comments: Note that a previously recommended radioligand ([³H]apafant; K_d 44.6 nM) is currently unavailable.

Prokineticin receptors

G protein-coupled receptors → Prokineticin receptors

Overview: Prokineticin receptors, PKR₁ and PKR₂ (**provisi-sional nomenclature as recommended by NC-IUPHAR [557]**) respond to the cysteine-rich 81-86 amino-acid peptides prokineticin-1 (*PROK1*, Q9HC23) (also known as endocrine gland-derived vascular endothelial growth factor, mambakine) and prokineticin-2 (*PROK2*, Q9HC23) (protein Bv8 homologue). An orthologue of PROK1 from black mamba (*Dendroaspis polylepis*) venom, mamba intestinal toxin 1 (MIT1, [1749]) is a potent, non-selective agonist at prokineticin receptors [1279], while Bv8, an orthologue of PROK2 from amphibians (*Bombina* sp., [1357]), is equipotent at recombinant PKR₁ and PKR₂ [1435], and has high potency in macrophage chemotaxis assays, which are lost in PKR₁-null mice.

Nomenclature	PKR ₁	PKR ₂
HCNC, UniProt	<i>PROKR1</i> , Q8TCW9	<i>PROKR2</i> , Q8NFH6
Potency order of endogenous ligands	prokineticin-2 (<i>PROK2</i> , Q9HC23) > prokineticin-1 (<i>PROK1</i> , Q9HC23) > prokineticin-2β (<i>PROK2</i>) [1175, 1279, 1843]	prokineticin-2 (<i>PROK2</i> , Q9HC23) > prokineticin-1 (<i>PROK1</i> , Q9HC23) > prokineticin-2β (<i>PROK2</i>) [1175, 1279, 1843]
Endogenous agonists	prokineticin-2 (<i>PROK2</i> , Q9HC23) [316, 1279], prokineticin-1 (<i>PROK1</i> , Q9HC23) [316, 1279], prokineticin-2β (<i>PROK2</i>) [316]	prokineticin-2 (<i>PROK2</i> , Q9HC23) [316, 1279], prokineticin-1 (<i>PROK1</i> , Q9HC23) [316, 1279], prokineticin-2β (<i>PROK2</i>) [316]
Agonists	MIT1 [1279]	MIT1 [1279]

(continued)	
Nomenclature	PKR ₁
Selective agonists	IS20 [612], IS1 [612]
Labelled ligands	[¹²⁵ I]BH-MITT1 (Agonist) [1279]
	PKR ₂
	–
	[¹²⁵ I]BH-MITT1 (Agonist) [1279]

Comments: Genetic mutations in *PROKR1* are associated with Hirschsprung’s disease [1688], while genetic mutations in *PROKR2* are associated with hypogonadotropic hypogonadism with anosmia [455], hypopituitarism with pituitary stalk interruption [1649] and Hirschsprung’s disease [1688].

Prolactin-releasing peptide receptor

G protein-coupled receptors → Prolactin-releasing peptide receptor

Overview: The precursor (*PRLH*, P81277) for PrRP generates 31 also known as P518 or 26Rfa. RFRP is an Rf amide-related peptide [794] derived from a FMRFamide-related peptide precursor (NPVF, Q9HCQ7), which is cleaved to generate neuropeptide SF (NPVF, O15130), neuropeptide RFRP-1 (NPVF, Q9HCQ7), neuropeptide RFRP-2 (NPVF, Q9HCQ7) and neuropeptide RFRP-3 (NPVF, Q9HCQ7) (neuropeptide NPVF).

Nomenclature	PrRP receptor
HGNC, UniProt	<i>PRLHR</i> , P49683
Potency order of endogenous ligands	PrRP-20 (<i>PRLH</i> , P81277) = PrRP-31 (<i>PRLH</i> , P81277) [1099]
Endogenous agonists	PrRP-20 (<i>PRLH</i> , P81277) [509, 1099], PrRP-31 (<i>PRLH</i> , P81277) [509, 1099]
Endogenous antagonists	neuropeptide Y (NPY, P01303) (pK _i 5.4) [1087]
Labelled ligands	[¹²⁵ I]PrRP-20 (human) (Agonist) [1099], [¹²⁵ I]PrRP31 (Agonist) [501]

Comments: The orphan receptor *GPR83* (Q9NVM4) shows sequence similarities with NPFF1, NPFF2, PrRP and QRFP receptors.

Prostanoid receptors

G protein-coupled receptors → Prostanoid receptors

Overview: Prostanoid receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Prostanoid Receptors [2132]**) are activated by the endogenous ligands prostaglandins PGD_2 , PGE_1 , PGE_2 , $\text{PGF}_{2\alpha}$, PGH_2 , prostacyclin [PGI_2] and thromboxane A_2 . Measurement of the potency of PGI_2 and thromboxane A_2 is hampered by their instability in physiological salt solution; they are often replaced by cicaprost and U46619, respectively, in receptor characterization studies.

Nomenclature	DP ₁ receptor	DP ₂ receptor
HCNC, UniProt	<i>PTGDR</i> , Q13258	<i>PTGDR2</i> , Q9Y5Y4
Potency order of endogenous ligands	$\text{PCD}_2 > \text{PGE}_1 \gg \text{PGE}_2 > \text{PGF}_{2\alpha} > \text{PGI}_2$, thromboxane A_2	$\text{PCD}_2 \gg \text{PGF}_{2\alpha}$, $\text{PGE}_2 > \text{PGI}_2$, thromboxane A_2
Selective agonists	BW 245C [173, 2133, 2134], L-644,698 [2133, 2134]	15(R)-15-methyl- PCD_2 [747, 1366, 1889] fevipiprant (pK_d 9) [1908, 1909], ramatroban (pK_i 7.4) [1889] CAV 10471 (pIC_{50} 8.9) [1684, 2003]
Antagonists	–	
Selective antagonists	laropiprant (pK_i 10.1) [1882], BWA868C (pK_i 8.6–9.3) [173, 640, 2133], ONO-AE3-237 (pK_i 7.7) [796, 1974, 1976]	CAY 10471 (pIC_{50} 8.9) [1684, 2003]
Labelled ligands	[³ H] PCD_2 (Agonist) [2119, 2133]	[³ H] PCD_2 (Agonist) [1280, 1790]

Nomenclature	EP ₁ receptor	EP ₂ receptor	EP ₃ receptor	EP ₄ receptor
HCNC, UniProt	<i>PTGER1</i> , P34995	<i>PTGER2</i> , P43116	<i>PTGER3</i> , P43115	<i>PTGER4</i> , P35408
Potency order of endogenous ligands	$\text{PGE}_2 > \text{PGE}_1 > \text{PGF}_{2\alpha}$, $\text{PGI}_2 > \text{PCD}_2$, thromboxane A_2	$\text{PGE}_2 = \text{PGE}_1 > \text{PGF}_{2\alpha}$, $\text{PGI}_2 > \text{PCD}_2$, thromboxane A_2	PGE_2 , $\text{PGE}_1 > \text{PGF}_{2\alpha}$, $\text{PGI}_2 > \text{PCD}_2$, thromboxane A_2	$\text{PGE}_2 = \text{PGE}_1 > \text{PGF}_{2\alpha}$, $\text{PGI}_2 > \text{PCD}_2$, thromboxane A_2
Endogenous agonists	–	PGE_2 [7, 1871, 2119]	PGE_2 (EP ₃ -III isoform) [7]	–
Agonists	17-phenyl- ω -trino- PGE_2 [1783]	PGE_1 [111]	misoprostol (methyl ester) (EP ₃ -III isoform) [7]	–
Selective agonists	ONO-DI-004 [1899] – Mouse	ONO-AEI-259 [1899] – Mouse, butaprost (free acid form) [7, 1871]	sulprostone (EP ₃ -III isoform) [7], ONO-AE-248 [562, 1206]	L902688 [563, 1129], ONO-AEI-329 [562, 563]
Antagonists	–	–	–	EP ₄ A (pK_i 7.6–8.5) [1229, 2195]

Proteinase-activated receptors

G protein-coupled receptors → Proteinase-activated receptors

Overview: Proteinase-activated receptors (PARs, **nomenclature as agreed by the NC-IUPHAR Subcommittee on Proteinase-activated Receptors [809]**) are unique members of the GPCR superfamily activated by proteolytic cleavage of their amino terminal exodomains. Agonist proteinase-induced hydrolysis unmasks a tethered ligand (TL) at the exposed amino terminus, which acts intramolecularly at the binding site in the body of the receptor to effect transmembrane signalling. TL sequences at human PAR1-4 are **SLLRN-NH₂**, **SLIGKV-NH₂**, **TFRGAP-NH₂**, and **GYTGQV-NH₂**, respectively. With the exception of PAR3, these synthetic peptide sequences (as carboxyl terminal amides) are able to act as agonists at their respective receptors. Several proteinases, including neutrophil elastase, cathepsin G and chymotrypsin can have inhibitory effects at PAR1 and PAR2 such that they cleave the exodomain of the receptor without inducing activation of Gαq-coupled calcium signalling, thereby preventing activation by activating proteinases but not by agonist peptides. Neutrophil elastase (NE) cleavage of PAR1 and PAR2 can however activate MAP kinase signalling by exposing a TL that is different from the one revealed by trypsin [1624]. PAR2 activation by NE regulates inflammation and pain responses [1397, 2217] and triggers mucin secretion from airway epithelial cells [2220].

	PAR1	PAR2	PAR3	PAR4
Nomenclature	PAR1	PAR2	PAR3	PAR4
HCNC, UniProt	F2R, P25116	F2RL1, P55085	F2RL2, O00254	F2RL3, Q96R10
Agonist proteases	thrombin (F2, P00734), activated protein C (PRC, P04070), matrix metalloproteinase 1 (MMP1, P45452), matrix metalloproteinase 13 (MMP13, P45452) [73]	Trypsin, tryptase, TF/VIIa, Xa	thrombin (F2, P00734)	thrombin (F2, P00734), trypsin, cathepsin G (CT5G, P08311)
Agonists	F16357	–	–	–
Selective agonists	TLER-NH ₂ [355]	AC264613 [1767], A777 [2178], AC-55541 [1767], GB110 [104], 2-furoyl-LIGRLO-amide [1305], SLIGKV-NH ₂ [1134], SLIGRL-NH ₂ [1134]	–	ATPGKF-NH ₂ , GYPGKF-NH ₂ , GYPGQV-NH ₂
Selective antagonists	vorapaxar (pK _i 8.1) [295], atropaxar (pIC ₅₀ 7.7) [1024], RWJ-56110 (pIC ₅₀ 6.4) [49]	GB88 (pIC ₅₀ 5.7) [1886], P2pal1 8s [1776]	–	YD-3 (pIC ₅₀ 6.9) [2091], ML354 (pIC ₅₀ 6.8) [2091]
Labelled ligands	[³ H]haTRAP (Agonist) [17]	2-furoyl-LIGRL[N-(Alexa Fluor 594)-O]-NH ₂ (Agonist) [810], 2-furoyl-LIGRL[N(³ H]propionyl)-O-NH ₂ (Agonist) [810], [³ H]2-furoyl-LIGRL-NH ₂ (Selective Agonist) [946], trans-cinnamoyl-LIGRLO [N- ³ H]propionyl]-NH ₂ (Agonist) [28]	–	–
Comments	TLER-NH ₂ is selective relative to the PAR ₂ receptor [159, 958].	2-Furoyl-LIGRLO-NH ₂ activity was measured via calcium mobilisation in HEK 293 cells which constitutively coexpress human PAR ₁ and PAR ₂ .	–	–

Comments: Endogenous serine proteases (EC 3.4.21.) activate at the proteinase-activated receptors include: **thrombin** (*F2*, **P00734**), generated by the action of Factor X (*F10*, **P00742**) on liver-derived prothrombin (*F2*, **P00734**); trypsin, generated by the action of enterokinase (*TMPRSS1*, **P8073**) on pancreatic-derived leukocytes; liver-derived protein C (*PROC*, **P04070**) generated in trypsinogen (*PRSS1*, **P07477**); tryptase, a family of enzymes (α/β 1 *TTSAB1*, **Q15661**; γ 1 *TTS61*, **Q9NRK2**; δ 1 *TPSD1*, **Q9BZJ3**) secreted from mast cells; cathepsin G (*CTSG*, **P08311**) generated from plasma by thrombin (*F2*, **P00734**) and matrix metalloproteinase 1 (*MMP1*, **P45452**).

QRRP receptor

G protein-coupled receptors → QRRP receptor

Overview: The human gene encoding the QRRP receptor (QRRPR, also known as the peptide P518 receptor), previously designated as an orphan GPCR receptor was identified in 2001 by Lee *et al.* from a hypothalamus cDNA library [1131]. However, the reported cDNA (AF411117) is a chimera with bases 1-127 derived from chromosome 1 and bases 155-1368 derived from chromosome 4. When corrected, QRRPR (also referred to as SP9155 or AQ27) encodes a 431 amino acid protein that shares sequence similarities in the transmembrane spanning regions with other peptide receptors. These include neuropeptide FF2 (38%), neuropeptide Y2 (37%) and galanin Gal1 (35%) receptors.

Nomenclature	QRRP receptor
HGNC, UniProt	QRRPR, Q96P65
Endogenous agonists	QRRP43 (QRRP, P83859) [311, 587, 1923] – Rat, QRRP26 (QRRP) [311, 910]
Agonists	IV-2172 [1448]
Selective antagonists	compound 25e (p)C ₅₀ 7.3 [628, 629]
Labelled ligands	[¹²⁵ I]QRRP43 (human) (Agonist) [587, 1063, 1923]

Comments: The orphan receptor *GPR83* (**9NNVM4**) shows sequence similarities with the QRRP receptor, as well as with the NPFF1, NPFF2, and PRRP receptors.

Further reading on QRRP receptor

Fukusumi S *et al.* (2006) Recent advances in mammalian Rfamide peptides: the discovery and functional analyses of PRRP, RFRPs and QRRP. *Peptides* **27**: 1073-86 [PMID:16500002]

Relaxin family peptide receptors

G protein-coupled receptors → Relaxin family peptide receptors

Overview: Relaxin family peptide receptors (RXFP, **nomenclature as agreed by the NC-IUPHAR Subcommittee on Relaxin family peptide receptors [112, 713]**) may be divided into two pairs, RXFP1/2 and RXFP3/4. Endogenous agonists at these receptors are a number of heterodimeric peptide hormones structurally related to insulin: relaxin-1 (*RLN1*, P04808), relaxin (*RLN2*, P04090), relaxin-3 (*RLN3*, Q8WXC3) (also known as INSL7), insulin-like peptide 3 (INSL3 (*INSL3*, P51460)) and

INSL5 (*INSL5*, Q9Y5Q6). Species homologues of relaxin have distinct pharmacology – relaxin (*RLN2*, P04090) interacts with RXFP1, RXFP2 and RXFP3, whereas mouse and rat relaxin selectively bind to and activate RXFP1 [1755] and porcine relaxin may have a higher efficacy than human relaxin (*RLN2*, P04090) [714]. Relaxin-3 (*RLN3*, Q8WXC3) has differential affinity for RXFP2 between species; mouse and rat RXFP2 have a higher affinity for relaxin-3 (*RLN3*, Q8WXC3) [1754]. At least two binding sites have been identified on RXFP1 and RXFP2: a high-affinity site in the leucine-rich repeat region of the ectodomain and a somewhat lower-affinity site located in the surface loops of the transmembrane domain [714, 1885]. The unique N-terminal LDL α module of RXFP1 and RXFP2 is essential for receptor signalling [1756].

Nomenclature	RXFP1	RXFP2	RXFP3	RXFP4
HCNC, UniProt	<i>RXFP1</i> , Q9HBX9	<i>RXFP2</i> , Q8WXD0	<i>RXFP3</i> , Q9NSD7	<i>RXFP4</i> , Q8TDU9
Potency order of endogenous ligands	relaxin (<i>RLN2</i> , P04090) = relaxin-1 (<i>RLN1</i> , P04808) > relaxin-3 (<i>RLN3</i> , Q8WXC3) [1885]	INSL3 (<i>INSL3</i> , P51460) > relaxin (<i>RLN2</i> , P04090) >> relaxin-3 (<i>RLN3</i> , Q8WXC3) [1072, 1885]	relaxin-3 (<i>RLN3</i> , Q8WXC3) > relaxin-3 (B chain) (<i>RLN3</i> , Q8WXC3) > relaxin (<i>RLN2</i> , P04090) [1186]	INSL5 (<i>INSL5</i> , Q9Y5Q6) = relaxin-3 (<i>RLN3</i> , Q8WXC3) > relaxin-3 (B chain) (<i>RLN3</i> , Q8WXC3) [1184, 1185]
Endogenous antagonists	–	–	INSL5 (<i>INSL5</i> , Q9Y5Q6) (pK _i 7) [2223]	–
Antagonists	B-R1 3/17K H2 relaxin (pEC ₅₀ 5.7–6.7) [827, 1446]	–	R3(B Δ 23-27)R/I5 chimeric peptide (pIC ₅₀ 9.2) [1064]	R3(B Δ 23-27)R/I5 chimeric peptide (pIC ₅₀ 8–8.6) [749, 1064]
Selective antagonists	–	A Δ 9-26)INSL3 (pK _i 9.1) [826], A(10-24)INSL3 (pK _i 8.7) [826], A(C10/15S)INSL3 (pK _i 8.6) [2210], INSL3 B chain dimer analogue 8 (pK _i 8.5) [1781], A(Δ 10/15C)INSL3 (pK _i 8.3) [2210], cyclic INSL3 B-chain analogue 6 (pK _i 6.7) [1779], INSL3 B-chain analogue (pK _i 5.1) [434], (des 1-8) A-chain INSL3 analogue [262]	minimised relaxin-3 analogue 3 (pK _i 7.6) [1777], R3-B1-22R (pK _i 7.4) [749]	minimised relaxin-3 analogue 3 (pIC ₅₀ 6.6) [1777]
Allosteric modulators	ML290 (Agonist) (pEC ₅₀ 7) [2146, 2149]	–	–	–
Labelled ligands	[³³ P]relaxin (human) (Agonist) [714, 1885], europium-labelled relaxin (Agonist) [1778], [¹²⁵ I]relaxin (human) (Agonist)	[¹²⁵ I]INSL3 (human) (Agonist) [1395], [³³ P]relaxin (human) (Agonist) [714, 1885]	[¹²⁵ I]relaxin-3 (human) (Agonist) [1186], [¹²⁵ I]relaxin-3-B/INSL5 A chimera (Agonist) [1184], europium-labelled relaxin-3-B/INSL5 A chimera (Agonist) [749]	[¹²⁵ I]relaxin-3 (human) (Agonist) [1185], [¹²⁵ I]relaxin-3-B/INSL5 A chimera (Agonist) [1184], europium-labelled mouse INSL5 (Agonist) [126], europium-labelled relaxin-3-B/INSL5 A chimera (Agonist) [749], europium-labelled INSL5 (pK _d 8.3) [749]
Comments	–	europium-labelled INSL3 is a fluorescent ligand for this receptor (K _d =1nM) [1780].	–	–

Comments: Relaxin is the cognate peptide ligand for RXFP1 and is in extended Phase III clinical trials for the treatment of acute heart failure [1322]. Relaxin has vasodilatory, anti-fibrotic, angiogenic, anti-apoptotic and anti-inflammatory effects. Small molecule allosteric agonists such as [ML290](#) have been developed [1787, 2149]. The antifibrotic actions of relaxin are dependent on the angiotensin receptor AT₂ [344]. RXFP2 and its cognate ligand INSL3 have a more specialized role with mutations reported in patients with cryptorchidism [538]. cAMP elevation is the major signalling pathway for RXFP1 and RXFP2 [834, 835], but RXFP1 also activates MAP kinases, nitric oxide signalling, tyrosine kinase

phosphorylation and relaxin can interact with glucocorticoid receptors [716]. RXFP1 signalling involves lipid rafts, residues in the C-terminus of the receptor and activation of phosphatidylinositol-3-kinase [717] and pre-assembled protein complexes [715]. Receptor expression profiles suggest that RXFP3 is a brain neuropeptide receptor and RXFP4 a gut hormone receptor with the relaxin-3/RXFP3 system modulating feeding [596, 597, 749, 1777, 1830], anxiety [1694, 2204], and reward and motivated goal-directed behaviours [821, 1694, 2055]. Relaxin-3 (*RLN3*, *Q8WXF3*) is an agonist at RXFP3 and RXFP4 whereas INSL5 (*INSL5*, *Q9Y5Q6*) is an agonist at RXFP4 and a weak antagonist

at RXFP3. Unlike RXFP1 and RXFP2, both RXFP3 and RXFP4 are encoded by a single exon. INSL5 is secreted from enteroendocrine L cells and the INSL5/RXFP4 system controls food intake and glucose homeostasis [685]. RXFP3 and RXFP4 couple to G_{i/o} and inhibit adenylyl cyclase [1186, 2014], and also cause Erk1/2 phosphorylation [2014]. RXFP4 also causes phosphorylation of p38MAPK, Akt and S6R [51]. There is evidence that at RXFP3, relaxin (*RLN2*, *P04090*) is a biased ligand compared to the cognate ligand relaxin-3.

Somatostatin receptors

G protein-coupled receptors → Somatostatin receptors

Overview: Somatostatin (somatotropin release inhibiting factor) is an abundant neuropeptide, which acts on five subtypes of somatostatin receptor (SST₁–SST₅; **nomenclature as agreed by the NC-IUPHAR Subcommittee on Somatostatin Receptors [829]**). Activation of these receptors produces a wide range of physiological effects throughout the body including the inhibition of secretion of many hormones. Endogenous ligands for these receptors are somatostatin-14 (SRIF-14 (SST, P612/78)) and somatostatin-28 (SRIF-28 (SST, P612/78)). Cortistatin-14 (Mouse, Rat) has also been suggested to be an endogenous ligand for somatostatin receptors [427].

Nomenclature	SST ₁ receptor	SST ₂ receptor	SST ₃ receptor	SST ₄ receptor	SST ₅ receptor
HCNC, UniProt	SSTR1, P30872	SSTR2, P30874	SSTR3, P32745	SSTR4, P31391	SSTR5, P35346
Agonists	pasireotide [1740]	pasireotide [1740]	pasireotide [1740], vapreotide [238, 1540, 1807]	NNC269100 [1197]	pasireotide [1740]
Selective agonists	L-797,591 [1669], Des-Ala ^{1,2,5} -[D-Trp ⁸ ,Iamp ⁹]SRIF [512]	L-054,522 [2172], BIM 23027 [283], octreotide [238, 1540, 1805, 1806, 1807, 2172]	L-796,778 [1669]	L-803,087 [1669]	BIM 23052 [1325, 1805, 1806, 1807], L-817,818 [1669]
Selective antagonists	SRA880 (pK _d 8–8.1) [831]	[D-Tyr ⁸]CYN 154806 (pK _d 8.1–8.9) [1478]	NVP ACQ090 (pK _i 7.9) [832]	–	–
Labelled ligands	–	[¹²⁵ I]Tyr ³ SMS 201-995 (Agonist) [1805, 1806], [¹²⁵ I]BIM23027 (Agonist) [811] – Rat	–	–	[¹²⁵ I]Tyr ³ SMS 201-995 (Agonist) [1805, 1806]

Comments: [¹²⁵I]Tyr¹¹-SRIF-14, [¹²⁵I]LTT-SRIF-28, [¹²⁵I]CGP 23996 and [¹²⁵I]Tyr¹⁰-CST14 may be used to label somatostatin receptors nonselectively. A number of nonpeptide subtype-selective agonists have been synthesised [1669]. Octreotide and lanreotide are being used in the treatment of SST₂-expressing neuroendocrine tumors and pasireotide for SST₅-expressing neuroendocrine tumors. A novel peptide somatostatin analogue, veldoreotide (somatoprim), has affinity for SST₂, SST₄ and SST₅ receptors and is a potent inhibitor of GH secretion [1586, 1793].

Succinate receptor

G protein-coupled receptors → Succinate receptor

Overview: Nomenclature as recommended by NC-IUPHAR [414] The Succinate receptor has been identified as being activated by physiological levels of the Krebs' cycle intermediate succinate and other dicarboxylic acids such as maleate in 2004. Since its pairing with its endogenous ligand, the receptor has been the focus of intensive research and its role has been evidenced in various (patho)physiological processes such as regulation of renin production, retinal angiogenesis or immune response.

Nomenclature	succinate receptor
HCNC, UnlProt	SUCNR1, Q9BXA5
Endogenous agonists	succinic acid [762, 1854]

Comments: In humans, there is the possibility of two open-reading frames (ORFs) for *SUCNR1*, allowing the generation of 330 or 334 amino acid proteins Wittenberger et al.[2127] noted that the 330-AA protein was more likely to be expressed given the Kozak sequence surrounding the second ATG. Some databases report *SUCNR1* as being 334-AA long.

Tachykinin receptors

G protein-coupled receptors → Tachykinin receptors

Overview: Tachykinin receptors (**provisional nomenclature as recommended by NC-IUPHAR [557]**) are activated by the endogenous peptides substance P (*TAC1*, P20366) (SP), neurokinin A (*TAC1*, P20366) (NKA; previously known as substance K, neurokinin α , neuromedin L), neurokinin B (*TAC3*, Q9UHF0) (NKB; previously known as neurokinin β , neuromedin K), neuropeptide K (*TAC1*, P20366) and neuropeptide γ (*TAC1*, P20366) (N-terminally extended forms of neurokinin A). The neurokinins (A and B) are mammalian members of the tachykinin family, which includes peptides of mammalian and nonmammalian origin containing the consensus sequence: Phe-x-Gly-Leu-Met. Marked species differences in *in vitro* pharmacology exist for all three receptors, in the context of nonpeptide ligands. Antagonists such as **aprepitant** and **fosaprepitant** were approved by FDA and EMA, in combination with other antiemetic agents, for the prevention of nausea and vomiting associated with emetogenic cancer chemotherapy.

Nomenclature	NK ₁ receptor	NK ₂ receptor	NK ₃ receptor
HCNC, UniProt	<i>TACR1</i> , P25103	<i>TACR2</i> , P21452	<i>TACR3</i> , P29371
Potency order of endogenous ligands	substance P (<i>TAC1</i> , P20366) > neurokinin A (<i>TAC1</i> , P20366) > neurokinin B (<i>TAC3</i> , Q9UHF0)	neurokinin A (<i>TAC1</i> , P20366) > neurokinin B (<i>TAC3</i> , Q9UHF0) ≫ substance P (<i>TAC1</i> , P20366)	neurokinin B (<i>TAC3</i> , Q9UHF0) > neurokinin A (<i>TAC1</i> , P20366) > substance P (<i>TAC1</i> , P20366)
Agonists	substance P-OME [1960]	–	–
Selective agonists	[Sar ⁹ ,Met(O ₂) ¹¹]SP [1960], septide [130, 746], [Pro ⁹]SP [1975] – Rat	[Ly ⁵ ,Me-Leu ⁹ ,Nle ¹⁰]NKA(4-10) [1292] – Rat, GR64349 [432] – Rat, [βAla ⁸]neurokinin A(4-10) [505]	[Phe(Me) ⁷]neurokinin B [1717, 1718], senktide [1717, 1718, 1960]
Selective antagonists	aprepitant (pK _i 10.1) [709, 710], CP 99994 (pK _i 9.3–9.7) [53, 1718], RP67580 (pIC ₅₀ 7.7) [555]	GR94800 (pK _i 9.8) [206], sareductant (pK _i 9.4–9.7) [53, 505, 1718], GR 159897 (pK _d 7.8–9.5) [137, 505, 1837], MEN10627 (pK _i 9.2) [638], nepadutant (pK _i 8.5–8.7) [284, 358]	osanetant (pK _i 8.4–9.7) [53, 116, 357, 504, 941, 1518, 1717, 1718, 1960], tainetant (pK _i 7.4–9) [133, 639, 1717, 1718], PD157672 (pIC ₅₀ 7.8–7.9) [168, 1960]
Labelled ligands	[¹²⁵ I]IL703,606 (Antagonist) (pK _d 9.5) [566], [¹²⁵ I]BH-[Sar ⁹ ,Met(O ₂) ¹¹]SP (Agonist) [1979] – Rat, [³ H]SP (human, mouse, rat) (Agonist) [84], [¹²⁵ I]SP (human, mouse, rat) (Agonist), [¹⁸ F]SPA-RQ (Antagonist) [332]	[³ H]sareductant (Antagonist) (pK _d 9.7) [683] – Rat, [¹²⁵ I]NKA (human, mouse, rat) (Agonist) [2077], [³ H]GR100679 (Antagonist) (pK _d 9.2) [705]	[³ H]osanetant (Antagonist) (pK _d 9.9), [³ H]senktide (Agonist) [693] – Guinea pig, [¹²⁵ I][MePhe ⁷]NKB (Agonist)

Comments: The NK₁ receptor has also been described to couple to G proteins other than G_{q/11} [1680]. The hexapeptide agonist septide appears to bind to an overlapping but non-identical site to substance P (*TAC1*, P20366) on the NK₁ receptor. There are suggestions for additional subtypes of tachykinin receptor; an orphan receptor (SwissProt P30098) with structural similarities to the NK₃ receptor was found to respond to NKB when expressed in *Xenopus* oocytes or Chinese hamster ovary cells [459, 1049].

Thyrotropin-releasing hormone receptors

G protein-coupled receptors → Thyrotropin-releasing hormone receptors

Overview: Thyrotropin-releasing hormone (TRH) receptors (**provisional nomenclature as recommended by NC-IUPHAR [557]**) are activated by the endogenous tripeptide TRH (TRH, P20396) (Glu-His-ProNH₂). TRH (TRH, P20396) and TRH analogues fail to distinguish TRH₁ and TRH₂ receptors [1896]. [³H]TRH (human, mouse, rat) is able to label both TRH₁ and TRH₂ receptors with K_d values of 13 and 9 nM respectively. Synthesis and biology of ring-modified L-Histidine containing TRH analogues has been reported [1316].

Nomenclature	TRH ₁ receptor	TRH ₂ receptor
HGNC, UniProt	TRHR, P34981	–
Antagonists	diazepam (pK _i 5.2) [471] – Rat	–
Selective antagonists	midazolam (pK _i 5.5) [471] – Rat, chlordiazepoxide (pK _i 4.8) [471] – Rat, chlordiazepoxide (pK _i 4.7) [1878] – Mouse	–
Comments	–	A class A G protein-coupled receptor: not present in man

Trace amine receptor

G protein-coupled receptors → Trace amine receptor

Overview: Trace amine-associated receptors were discovered from a search for novel 5-HT receptors [189], where 15 mammalian orthologues were identified and divided into two families. The TA₁ receptor (**nomenclature as agreed by the NC-IUPHAR Subcommittee for the Trace amine receptor** [1244]) has affinity for the endogenous trace amines tyramine, β-phenylethylamine and octopamine in addition to the classical amine dopamine [189]. Emerging evidence suggests that TA₁ is a modulator of monoaminergic activity in the brain [2151] with TA₁ and dopamine D₂ receptors shown to form constitutive heterodimers when co-expressed [519]. In addition to trace amines, receptors can be activated by amphetamine-like psychostimulants, and endogenous thyronamines.

Nomenclature	TA ₁ receptor
HGNC, UniProt	TAAR1, Q96R10
Potency order of endogenous ligands	tyramine > β-phenylethylamine > octopamine = dopamine [189]
Agonists	RO5166017 [1648]
Antagonists	EPPTB (inverse agonist) (pIC ₅₀ 5.1) [205]
Labelled ligands	[³ H]tyramine (Agonist) [189]

Comments: In addition to TA₁, in man there are up to 5 functional TAAR genes (TAAR2,5,6,8,9). See [189] for detailed discussion. The product of the gene TAAR2 (also known as GPR58) appears to respond to β-phenylethylamine > tyramine and to couple through G_s [189]. TAAR3, in some individuals, and TAAR4 are pseudogenes in man, although functional in rodents. The signalling characteristics and pharmacology of TAAR5 (P2YR, Putative Neurotransmitter Receptor: TAAR5, O14804), TAAR6 (Trace amine receptor 4, Tar-4: TAAR6, 96R8), TAAR8 (Trace amine receptor 5, GPR102: TAAR8, Q969N4) and TAAR9 (trace amine associated receptor 9: TAAR9, 96R19) are lacking. The tyronamines, endogenous derivatives of thyroid hormone, have affinity for rodent cloned trace amine receptors, including TA₁ [1728]. An antagonist EPPTB has recently been described with a pK_i of 9.1 at the mouse TA₁ but > 5.3 for human TA₁ [1863].

Urotensin receptor

G protein-coupled receptors → Urotensin receptor

Overview: The urotensin-II (U-II) receptor (UT, **nomenclature as agreed by the NC-IUPHAR Subcommittee on the Urotensin receptor** [466, 557, 2032]) is activated by the endogenous dodecapeptide urotensin-II (UTS2, Q95399), originally isolated from the urophysis, the endocrine organ of the caudal neurosecretory system of teleost fish [138]. Several structural forms of U-II exist in fish and amphibians. The goby orthologue was used to identify U-II as the cognate ligand for the predicted receptor encoded by the rat gene *gpr14* [389, 1195, 1379, 1476]. Human urotensin-II (UTS2, Q95399), an 11-amino-acid peptide [389], retains the cyclonexapeptide sequence of goby U-II that is thought to be important in ligand binding [224, 1003]. This sequence is also conserved in the deduced amino-acid sequence of rat urotensin-II (Rat) (14 amino-acids) and mouse urotensin-II (Mouse) (14 amino-acids), although the N-terminal is more divergent from the human sequence [388]. A second endogenous ligand for the UT has been discovered in rat [1890]. This is the urotensin II-related peptide (UTS2B, Q76510), an octapeptide that is derived from a different gene, but shares the C-terminal sequence (CFWKYCV) common to U-II from other species. Identical sequences to rat urotensin II-related peptide (UTS2B, Q76510) are predicted for the mature mouse and human peptides [472]. UT exhibits relatively high sequence identity with somatostatin, opiod and galanin receptors [2032].

Nomenclature	UT receptor
HGNC, UniProt	<i>UTS2R</i> , Q9UKR6
Endogenous agonists	urotensin II-related peptide (<i>UTS2R</i> , Q76510) [472, 1243], urotensin-II (<i>UTS2</i> , O95399) [467, 503, 681]
Selective agonists	[Pen ⁵]U-(4-11) (human) [681], U-I-(4-11) (human) [681], [3-iodo-Tyr ⁶]U-I-(4-11) (human) [1084], Urolinin [95], FL104 [1139, 1141], AC-7954 [398, 1140]
Selective antagonists	[N]-39319202 (pK _i 8.4) [1106], urantide (pK _i 8.3) [1536], SB-706375 (pK _i 8) [467], [Orn ⁵]URP (pK _i 7.2) [445] – Rat, palosuran (pIC ₅₀ 7.1) [366], SB-436811 (pK _i 6.7) [912] – Rat, SB-611812 (pK _i 6.6) [1622], S6716 (inverse agonist) (pIC ₅₀ 6.4) [554], [Cha ⁶]U-I-(4-11) (pK _i 6.4) [312] – Rat
Labelled ligands	[¹²⁵ I]U-II (human) (Agonist) [42, 198, 312, 1243], [¹²⁵ I]N-biotin-[Ahx ⁶ , Bpa ³]U-II (human) [454]

Comments: In the human vasculature, human urotensin-II (*UTS2*, O95399) elicits both vasoconstrictor (pD₂ 9.3-10.1, [1243]) and vasodilator (pIC₅₀ 10.3-10.4, [1872]) responses.

Vasopressin and oxytocin receptors

G protein-coupled receptors → Vasopressin and oxytocin receptors

Overview: Vasopressin (AVP) and oxytocin (OT) receptors (**nomenclature as recommended by NC-IUPHAR [557]**) are activated by the endogenous cyclic nonapeptides vasopressin (AVP, P01185) and oxytocin (OXT, P01178). These peptides are derived from precursors which also produce neuropeptides (neurophysin I for oxytocin, neurophysin II for vasopressin).

Nomenclature	V1A receptor	V1B receptor
HGNC, UniProt	<i>AVPR1A</i> , P37288	<i>AVPR1B</i> , P47901
Potency order of endogenous ligands	vasopressin (AVP, P01185) > oxytocin (OXT, P01178)	vasopressin (AVP, P01185) > oxytocin (OXT, P01178)
Endogenous agonists	vasopressin (AVP, P01185) [24, 326, 383, 439, 1418, 1571, 1702, 1913, 1914, 1945, 1946, 2162]	vasopressin (AVP, P01185) [24, 326, 439, 682, 1418, 1702, 1913, 1914, 1946, 2162]
Selective agonists	F180 [50, 383]	d[Leu ⁴]VP [1553], d[Cha ⁴]AVP [439, 682]
Antagonists	conivaptan (pK _i 8.2-8.4) [1913, 1914]	nelivaptan (pK _i 8.4-9.3) [678, 682, 1773]
Selective antagonists	relcovaptan (pK _i 8.1-9.3) [24, 383, 682, 1571, 1771, 1913, 1945, 1946, 1986], d(CH ₂) ₅ [Tyr(Me) ² -Arg ⁸]VP (pK _i 9)	–

(continued)	
Nomenclature	V _{1A} receptor
Labelled ligands	[1 ²⁵]OH-LVA (Antagonist) (pK _d 10.3–10.4) [334, 383, 1571], [³ H]AVP (human, mouse, rat) (Agonist) [214, 334, 383, 384, 1418, 1571, 1702, 1913, 1914, 1945, 1946, 1986, 2162], [³ H](dCH ₂) ₅ [Tyr(Me) ²]AVP (Antagonist) (pK _d 9)
	V _{1B} receptor
	[³ H]AVP (human, mouse, rat) (Agonist) [214, 334, 383, 384, 1418, 1571, 1702, 1913, 1914, 1945, 1946, 1986, 2162]

Nomenclature	V ₂ receptor	OT receptor
HGNC, UniProt	AVPR2, P30518	OXTR, P30559
Potency order of endogenous ligands	vasopressin (AVP, P01185) > oxytocin (OXT, P01178)	oxytocin (OXT, P01178) > vasopressin (AVP, P01185)
Endogenous agonists	vasopressin (AVP, P01185) [24, 326, 334, 439, 1418, 1702, 1771, 1913, 1914, 1946, 2162]	oxytocin (OXT, P01178) [24, 334, 335, 360, 682, 895]
Selective agonists	VNA932 [527], OPC-51803 [1418], d[Val ⁴ , DArg ⁸]VP	[Thr ⁴ , Gly ⁷]OT [335, 500, 895]
Antagonists	–	L-371,257 (pK _i 8.8) [682]
Selective antagonists	conivaptan (pK _i 9.4) [397], tolvaptan (pK _i 9.4) [2162], satavaptan (pK _i 8.4–9.3) [24, 383, 384, 1770, 1771, 1913, 1986], lixivaptan (inverse agonist) (pK _i 8.9–9.2) [33, 1771], d(CH ₂) ₅ [D-Ile ² , Ile ⁴]AVP (pK _i 6.9–8.4) [1771], mozavaptan (inverse agonist) (pK _i 7.4–8.1) [384, 1771, 1913, 1946, 2162, 2163]	SSR126768A (pK _i 8.8–9.1) [1772], desGlyNH ₂ -d(CH ₂) ₅ [Tyr(Me) ² , Thr ⁴ , Orn ⁸]OT (pK _i 8.5), L-372662 (pK _i 8.4) [127]
Labelled ligands	[³ H]AVP (human, mouse, rat) (Agonist) [334, 383, 384, 1418, 1702, 1913, 1914, 1946, 1986, 2162], [³ H]DAVP (Agonist) [334, 384, 1946], [³ H]desGly-NH ₂ [D-Ile ² , Ile ⁴]VP (pK _d 8.6)	[1 ²⁵]d(CH ₂) ₅ [Tyr(Me) ² , Thr ⁴ , Orn ⁸ , Tyr-NH ₂ ⁹]OV ⁷ (Antagonist) (pK _d 10), [³ H]OT (human, mouse, rat) (Agonist) [334, 583, 895, 998], [¹¹¹ In]DOTA-DLVT (pK _d 8.3) [333]

Comments: The V₂ receptor exhibits marked species differences, such that many ligands (d(CH₂)₅[D-Ile², Ile⁴]AVP and [³H]desGly-NH₂[D-Ile², Ile⁴]VP) exhibit low affinity at human V₂ receptors [29]. Similarly, [³H]d[D-Arg⁸]VP is V₂ selective in the rat, not in the human [1702]. The gene encoding the V₂ receptor is polymorphic in man, underlying nephrogenic diabetes insipidus [152]. D[Cha⁴]AVP is selective only for the human and bovine V_{1B} receptors [439], while d[Leu⁴]LVP has high affinity for the rat V_{1B} receptor [1553].

VIP and PACAP receptors

G protein-coupled receptors → VIP and PACAP receptors

Overview: Vasoactive intestinal peptide (VIP) and pituitary adenylate cyclase-activating peptide (PACAP) receptors (**nomenclature as agreed by the NC-IUPHAR Subcommittee on Vasoactive Intestinal Peptide Receptors [739, 740]**) are activated by the endogenous peptides VIP (VIP, P01282), PACAP-38 (ADCYAP1, P18509), PACAP-27 (ADCYAP1, P18509), peptide histidine isoleucineamide (PHI [Mouse, Rat]), peptide histidine methionineamide (PHM (VIP, P01282)) and peptide histidine valine (PHV (VIP, P01282)). VPAC₁ and VPAC₂ receptors display comparable affinity for the PACAP peptides, PACAP-27 (ADCYAP1, P18509) and PACAP-38 (ADCYAP1, P18509), and VIP (VIP, P01282), whereas PACAP-27 (ADCYAP1, P18509) and PACAP-38 (ADCYAP1, P18509) are > 100 fold more potent than VIP (VIP, P01282) as agonists of most isoforms of the PAC₁ receptor. However, one splice variant of the human PAC₁ receptor has been reported to respond to PACAP-38 (ADCYAP1, P18509), PACAP-27 (ADCYAP1, P18509) and VIP (VIP, P01282) with comparable affinity [411]. PG 99-465 [1374] has been used as a selective VPAC₂ receptor antagonist in a number of physiological studies, but has been reported to have significant activity at VPAC₁ and PAC₁ receptors [446]. The selective PAC₁ receptor agonist maxadilan, was extracted from the salivary glands of sand flies (*Lutzomyia longipalpis*) and has no sequence homology to VIP (VIP, P01282), or the PACAP peptides [1383]. Two deletion variants of maxadilan, M65 [1994] and Max.d.4 [1384] have been reported to be PAC₁ receptor antagonists, but these peptides have not been extensively characterised.

Nomenclature	PAC ₁ receptor	VPAC ₁ receptor	VPAC ₂ receptor
HCNC, UniProt	ADCYAP1R1, P41586	VIPR1, P32241	VIPR2, P41587
Potency order of endogenous ligands	PACAP-27 (ADCYAP1, P18509), PACAP-38 (ADCYAP1, P18509) ≫ VIP (VIP, P01282)	VIP (VIP, P01282), PACAP-27 (ADCYAP1, P18509), PACAP-38 (ADCYAP1, P18509) ≫ GHRH (GHRH, P01286), PHI [Pig], secretin (SCT, P09683)	VIP (VIP, P01282), PACAP-38 (ADCYAP1, P18509), PACAP-27 (ADCYAP1, P18509) > PHI [Pig] ≫ GHRH (GHRH, P01286), secretin (SCT, P09683)
Selective agonists	maxadilan [446]	[Lys ¹⁵ , Arg ¹⁶ , Leu ²⁷]VIP-(1-7)/GRF-(8-27)-NH ₂ [1369], [Ala ¹¹ , 22, 28]VIP [1458]	Ro 25-1553 [669, 930, 1369], Ro 25-1392 [2144]
Selective antagonists	–	PG 97-269 (pIC ₅₀ 8.7) [668, 930]	–
Labelled ligands	[¹²⁵ I]PACAP-27 (Agonist) [1581]	[¹²⁵ I]VIP (human, mouse, rat) (Agonist) [1458], [¹²⁵ I]PACAP-27 (Agonist)	[¹²⁵ I]VIP (human, mouse, rat) (Agonist) [1458], [¹²⁵ I]PACAP-27 (Agonist)

Comments: Subtypes of PAC₁ receptors have been proposed based on tissue differences in the potencies of PACAP-27 (ADCYAP1, P18509) and PACAP-38 (ADCYAP1, P18509); these might result from differences in G protein coupling and second messenger mechanisms [2018], or from alternative splicing of PAC₁ receptor mRNA [1859].
